# The lwarp package

LaTeX to HTML

v0.895 — 2021/02/18

**Abstract**

The lwarp package converts LaTeX to HTML by using LaTeX to process the user's document and directly generate HTML tags. External utility programs are only used for the final conversion of text and images. Math may be represented by SVG images or MathJax. More than 500 LaTeX packages and classes are supported, of which more than 90 also support MathJax.

Documents may be produced by DVI or PDF LaTeX, LuaLaTeX, XeLaTeX; by several CJK engines, classes, and packages; or by customized systems such as perltex and pythontex. A *texlua* script automates compilation, index, glossary, and batch image processing, and also supports *latexmk*. Configuration is semi-automatic at the first manual compile. Support files are self-generated. Print and HTML versions of each document may coexist.

Assistance is provided for HTML import into EPUB conversion software and word processors.

Requirements include the commonly-available Poppler utilities (included with MiKTeX) and Perl. Detailed installation instructions are included for each of the major operating systems and TeX distributions.

A quick-start tutorial is provided, as well as extensive documentation for special cases, a general index, and a troubleshooting index. Automatic error testing is provided for configuration files, package load order, and image generation.

SVG math and many other generated images include LaTeX expressions in the `alt` tags. MathJax may be used with advanced equation numbering under the direct control of lwarp.

Complicated tables are supported, which copy/paste well into LibreOffice Writer.

Supported classes and packages include memoir and koma-script, cleveref, caption, mdframed, siunitx, and many popular packages for tabulars, floats, graphics, theorems, the title page, bibliography, indexing, footnotes, and editorial work, as well as a number of CJK-related classes and packages.

TeX is a self-modifying tokenized macro-expansion language. Since lwarp is written directly in LaTeX, it is able to interpret the document's meaning at a deeper level than external conversions which merely approximate TeX. HTML5 and CSS3 are leveraged to provide advanced features such as booktabs trim, multicolumns, side-by-side minipages, and JavaScript-free navigation.

For a list of supported features, see table 2: Supported packages and features.

To update existing projects, see section 1: Updates.

**Lwarp is still in development. Changes are likely.**

# Support TEX development

TEX and related projects:

- are mostly open-sourced and a volunteer effort;
- benefit students, academics, scientists, engineers, and businesses;
- help drive education, public and private research, and commercial activity;
- are used in the fields of mathematics, science, engineering, and humanities;
- are international in reach;
- span decades of development;
- are enduring — many older packages are still actively used and maintained;
- are largely backwards compatible;
- are portable across all the major computing platforms;
- are usable even on older computers and away from internet access;
- are continuing to maintain relevance with modern improvements;
- require no yearly subscription fees;
- and are supported by an active community of knowledgeable volunteers.

Please consider helping by joining and/or contributing to the TEX Users Group, a United States 501(c)(3) tax-exempt charitable organization. Contributions are accepted by credit card, check, or Pay Pal, via the United Way, or by USA or European bank transfer. Membership in TUG supports the development of TEXLive, the major TEX distribution.

Donations may be directed towards individual projects:

**TUG Bursary Fund:** Assistance for attending annual TUG meetings.
**CTAN:** The Comprehensive TEX Archive Network — Central storage for TEX.
**TeX Development Fund:** Support for specific projects.
**EduTeX:** Teaching and using TEX in schools and universities.
**GUST e-foundry fonts:** Enhanced for math and additional language groups.
**LaTeX Project:** Modernizing the LATEX core.
**Libre Font Fund:** Fonts, tools (FontForge), and distribution (the Open Font Library).
**LuaTeX:** Combining the pdfTEX engine and the Lua language.
**MetaPost:** Postscript graphics.
**MacTeX:** TEX for Mac.
**PDF Accessibility:** Modern PDF standards.
**Other:** Additional projects may be specified.

# 1 Updates

The following is a summary of updates to lwarp, highlighting new features and any special changes which must be made due to improvements or modifications in lwarp itself.

For a detailed list of the most recent changes, see the end of the Change History on page 1323.

**v0.895:** Vector packages, greatly improved MathJax for siunitx.

core
- Fixed quotes in HTML tags while using old font packages with XeLaTeX and LuaLaTeX.

MathJax
- Added `\ifblank` and `\ifstrequal` to MathJax emulation.

packages
- multirow: Allow `\par` per v2.7.
- acro: Updated to v3.5.
- fancyhdr: Updated to v4.0.
- changes: Updated to v4.0.1.
- epsfig, rotating: Now work inside `lateximage`.
- amscdx: Verified to work with SVG math. Warning added about use with MathJax.
- Added MathJax emulation for isomath, mattens, maybemath, skmath, tensor.
- Improved MathJax emulation for siunitx `\ang`, `\num`, `\SI`.
- Added epsf, impnattypo, isotope, lpic, luavlna, mdwmath, pinlabel, rlepsf, tikz-imagelabels, xevlna.
- Verified to work as-is: tensind.

**v0.894:** MathJax additions and improvements.

MathJax
- Improved warning message for enabling SVG graphics for select math expressions while using MathJax.
- Accept and ignore a star for `\hspace`.
- Ignores `\arabic`, `\number`, `\noalign`.

packages
- Added MathJax emulation for backnaur, colortbl, nicematrix.
- booktabs: MathJax emulation now absorbs and discards trim.
- menukeys: Updated to v1.6.1.

**v0.893:** Minor fixes, more packages.

MathJax
- Added MathJax emulation for `\mathnormal`.

packages
- Fixed pstricks `pspicture*`.
- Fixed tikz font macros.
- braket: Now uses the MathJax extension.
- Added esvect, fixmath, keystroke, mathastext, menukeys, picinpar, plimsoll, repltext, selectp, seqsplit, simplebnf, statistics, swfigure.
- Added MathJax emulation for mathspec.
- Verified to work as-is for apxproof, syntaxdi, venndiagram.

**v0.892:** minted, fvextra, MathJax `\left/\right`.

MathJax
- fourier, libertinust1math, newpxmath, newtxmath, newtxsf, unicode-math: Added MathJax `\left/\right` support for additional delimiters.

packages
- textpos: Updated to v1.10.
- xcolor: Fixed optional args for `\fcolorbox` and related.
- Added fvextra, minted.

**v0.891:** MathJax additions and improvements.

core
- Now displays inline `\verb` text as `\texttt`.
- Fixed alltt and verbatims with LaTeX lists.
- Now generates an error if nested each of `warpHTML`, `warpprint`, `warpMathJax` inside itself.

MathJax
- Added MathJax *textmacros* extension, allowing formatting inside `\text`.

packages
- biblatex, hyperref: Added back page references.
- fancyvrb: Fixed `BVerbatim` with a label.
- listings: Fixed MathJax with captions, improved HTML sanitation.
- babel-french: Fixed `\texorpdfstring` conflict.
- Now honors Greek package options for mathdesign, mathpazo, mathptmx, newpxmath, newtxmath.
- Improved MathJax for colonequals, mathdesign, mathdots, mathfixs, mathtools, multiobjective, nicefrac, shuffle, units.
- unicode-math: Added Greek macros, as well as macros for the first several categories listed in **`texdoc unimath-symbols`**. Improved symbol shape macros with Greek. Improved documentation.
- Added bussproofs, cmbright, fourier, kpfonts, kpfonts-otf, libertinust1math, scalerel, txgreeks.

**v0.89:** Additional MathJax support.

core
- Adapted to upcoming LaTeX kernel changes.
- Allows load of amsmath before lwarp.

*lwarpmk*
- Also removes `*.bbl` when cleaning aux files.

MathJax
- MathJax: Neutralized `\protect`, `\mathcode` and related, ligatures. Fixed nested environments.

packages
- caption: Updated for v3.5, fix for label sep.
- thmtools: Updated for v0.72. Fixed `swapnumber`, `margin`.
- Improved MathJax for centernot, mathtools, mismath, SIunits, siunitx, statmath.
- Added MathJax emulation for accents, hepunits, hhtensor, mathalpha, mathdesign, mathpazo, mathptmx, mleftright, newpxmath, newtxmath, newtxsf, pxfonts, shuffle, txfonts, upgreek, ushort.
- Verified to work as-is: authoraftertitle.

**v0.88:** Indexing, boxing, theorems.

- Now has programmed support for more than 500 packages and classes, of which more than 60 also support MathJax.

core
- Fixed: `\ref*`, and also added MathJax emulation.
- If starting a new paragraph, `\hrulefill` creates a `<div>` with a thin horizontal line across the page. Use instead of `\hrule`.
- Fixed: Use `\chaptername` where appropriate.
- Fixed: Inline links causing extraneous paragraphs.

*lwarpmk*
- Added **`lwarpmk -v`** to print the version number.

indexing
- Added the `IndexRef` option to control the display of index entries. See section 7.5.
- Added `\IndexPageSeparator` and `\IndexRangeSeparator` for custom index styles.
- Added support for gindex, *xindex*.
- Verified to work as-is with varindex.

packages
- cleveref, varioref: Fix for starred macros.
- varioref: Removed page-related text from HTML output.
- xfakebold: Updated to v0.08, using pdfrender.
- caption, scrextend: Fixed `\caption*`.
- Added fbox, shadethm, tcolorbox, termcal, thmbox, thmtools.

**v0.87:** MathJax, bibliography packages.

core
- Added boolean `FixSmallCaps` for fonts which render small caps as all caps.
- Fixed `\bibliography` to use the HTML version's `.bbl` file. Previously the HTML bibliography relied on the print version's `.bbl`, thus would fail if the print document had not yet been created.

MathJax
- Added `\ifstar` and `\ifnextchar` to MathJax, and removed `\DeclareIfstar`. See section 8.7.5.

⚠ Removed `\DeclareIfstar`

packages
- physics: Now supports the MathJax v3 extension.
- mathtools: Improved `\underbrakcet`, `\overbracket` for MathJax.
- nccmath: Improved `\underrel` for MathJax.
- mhchem: Now supports the MathJax v3 extension for `\ce` inside math.
- cancel: Now supports the MathJax v3 extension.
- embrac: Neutralized kerning for improved HTML conversion.
- Added citeref, drftcite, jurabib, multibib, splitbib.
- Verified to work as-is with bibtopic, collref, mciteplus.

**v0.86:** MathJax major updates.

core
- Fixed: Filename if named files with *, parens, period in section name.
- Fixed: Labels in `eqnarray`, `lateximage`.

MathJax
- Updated to MathJax v3. New repository.
- Fixed forward references for MathJax.
- Improved MathJax equation number formatting, now compatible with amsmath `\numberwithin` for chapters, sections, subsections, as well as amsmath `subequations`. See section 8.7.5.
- Added `\DeclareIfstar` to define starred TeX macros in MathJax. See section 8.7.5.
- Generates an error if `\MathJaxFilename` file does not exist.

packages
- mathtools, nccmath, physics: Added starred macros for MathJax.
- nccmath: Fixed `\nr`, `\displaybreak` for MathJax.
- xcolor: Fixed `\textcolor` with babel-french.

**v0.85:** fontspec

packages
- fontspec: Fixed core font change macros for world languages.

⚠ acro formats
- acro: Due to v3 changes, when defining acronym formats, use `\textbf` instead of `\bfseries`, etc.
- Fixed idxlayout, mathtools, titlesec, url.

**v0.84:** Previous/next page links, numerous fixes.

docs
- Added documentation of `BlockClass` and `\InlineClass` for css `<div>`s and `<span>`s. See section 7.8.

- Added `\LinkPrevious`, `\LinkNext` page links. See section 7.6.

⚠ home page footer changed
- Added `\FirstPageBottom`. Home page no longer shares `\PageBottom`. See section 7.6.

core
- Improved coexistence with comment, support for nested environments.
- No longer requires but still supports the caption package.
- Improved filenames and HTML titles when using special characters.

⚠
- Change: Append `-0` to section named Index previously _index to distinguish from `index.html`

- Fixed style tags for `\multicolumn`, `\multirow`.
- Fixed spacing in `tabbing`.
- Fixed `lateximage` for: `quote`, `quotation`, `verse`, `center`, `flushleft`, `flushright`, `<par>` tags, packages verbatim, alltt, epigraph.
- Fixed textcomp due to integration into LaTeX kernel.
- Fixed `\itshape`, etc. Adapted to LaTeX fontaxes integration.
- Fixed `\@fnsymbol`.
- Warns about section names with dollar-delimited math.
- Warns about a `<span>` containing a float, caption, section, mdframed, or other `<div>` object.

- Only warn about XeTeX logo and graphics if actually used `\Xe`.

*lwarpmk*
- **`lwarpmk clean`** also removes `comment_*.cut`.

packages
- scrextend, scrartcl, scrbook: Added `\titlehead`, `\subject`, `\subtitle`, `\publishers`.
- titling: Fixed `\printthanks`.
- memoir, abstract: Fixed for updated memoir.
- memoir: Fixed `\newcomment`, pagenotes, crossreferences. Fixed setting a recursive name.
- Fixed or improved: amsthm, backref, biblatex, fixme, nfssext-cfr, ntheorem, parcolumns, realscripts, rotfloat, titling.
- Added boxedminipage, renamed from boxedminipage2e per author.
- Verified to work as-is with mcite.

**v0.83:** memoir fixes.

packages
- memoir: Various fixes and updates.
- physunits: Updated to v1.0.4.

**v0.82:** MathJax notes, xpinyin improvements, various updates.

MathJax
- Improved footnotes with MathJax.
- Added MathJax emulation for endnotes, marginnote, nccfoots, pagenote, parnotes, sidenotes.

packages
- xpinyin: Added pinyin with modern HTML.
- luatexko: Added `\dotemph`, `\ruby`, `\uline`, etc.
- soul: Fixed `\<`.
- chemfig: Updated to v1.5.
- draftwatermark: Updated to v2.0.
- ulem: Fixed: `\dashuline`.
- amsmath: Fixed: `\intertext` with MathJax.
- endnotes: Fixed: Marks in print mode.
- tocvsec2, tableof: Verified to work as-is.
- Added etoc (nullified).

**v0.81:** MathJax speedup and additional emulations.

core
- Improved warning regarding SVG math sizing/baselines and graphics/graphicx. See section 8.7.

MathJax
- Improved MathJax emulation processing speed.
- Added MathJax emulation for accsupp, axessibiltiy, colonequals, decimal, dotlessi, econometrics, engtlc, multiobjective, physunits, SIunits, stackrel, statmath.

packages
- axessibility: Updated to 2020/01/08 version.
- gridset: Updated to v0.3.
- SIunits: Fixed for math mode.
- Added DotArrow, nolbreaks, luamplib, returntogrid, statex2, tagpdf.
- Verified to work as-is with icomma, mathpunctspace, textualicomma.

**v0.80:** MathJax, biblatex.

MathJax
- Added docs and warning/info messages re: avoiding slow MathJax compilation. See section 8.7.5, Customizing MathJax.
- Added MathJax emulation for accessibility, autobreak, centernot, extarrows, fouridx, gensymb, leftidx, mathcomp, mathdots, mathfixs, mismath, nccmath, noitcrul, pdfcomment, relsize, rmathbr, subsupscripts, xfrac.
- Improved MathJax emulation for unicode-math.

packages
- biblatex, url: Now create hyperlinks.
- amsmath: Fix to center starred environments.
- xcolor, graphics: Made more macros robust.
- colortbl: Fix: Rule color in a `lateximage`.
- chemmacros: Updated to v5.10.
- Added fewerfloatpages, ghsystem, hhline, mismath, nccmath.

**v0.79:** MathJax, nested `tabular`.

MathJax
- Added or improved MathJax emulation for amsmath, ar, arydshln, bm, bigdelim, bigstrut, booktabs, braket, mathtools, multirow, physics, siunitx, slashed, unicode-math, xfakebold.
- Warn if using certain packages not supported by MathJax.

core
- `tabular`: Now may be nested.
- `minipage`, `\parbox`, `fminipage`, `\makebox`, `\framebox`: Fix: Adjust for virtual page size.
- Uses new iftex.

packages
- graphicx: Fix: Negative angles.
- caption: Fix: `\captionlistentry` with longtable.
- multirow: Fix: Centered vertical alignment.
- siunitx: Fix: `\square`, `\cubed`.
- booktabs: Fix: memoir with `lateximage`.
- babel and polyglossia: Added troubleshooting warnings.
- fontawesome, fontawesome5: Supports text color and size.
- transparent: Fix: `lateximages`.
- epigraph: Updated to v1.5e.
- xurl: Updated to v0.08.
- subcaption: Fixed with memoir.
- floatrow: Fix: `\linewidth`. No longer require float, graphics.
- floatflt, wrapfig, niceframe: Fix: Adjust for virtual page size.
- Added widetable, witharrows, steinmetz.
- Added awesomebox, catoptions.
- Added svg, supports svg-extract.
- Added parcolumns, pdfcolparcolumns,
- Added parallel, pdfcolparallel.
- Added pdfcol, pdfcolfoot, pdfcolmk.

**v0.78:** Fixes for support files, `alt` tags, hyperlinks, and the 2019/10 LaTeX release.

docs
- Docs: Improved documentation regarding package options. See section 8.1.
- Fix to overwrite existing support files using new `filecontents` environment.

packages
- breqn: Previously broken by the 2019/10 LaTeX update, but now working again.
- graphics: Fix for `\includegraphics` `alt` tags.
- babel-french: Fix for hyperlinks.
- media9, movie15, multimedia: Fix for the 2019/10 LaTeX update.
- accessibility: Added.

**v0.77:** Updates to fix recently-broken packages.

- booktabs: Updated to v1.6180339.
- chemformula: Updated to v4.15.

**v0.76:** MathJax, updates for LaTeX 2019/10 release.

docs
- Docs: Expanded documentation regarding the use of multiple projects in the same directory. See section 5.17.

MathJax
- MathJax: Updated to v2.7.6.

packages
- xr: Updated to v5.05.
- xr-hyper: Updated to v6.1.
- Verified works as-is with xcite.
- acro: Updated to v2.10.

⚠ broken
- Currently broken in print mode by the 2019/10 LaTeX update, and waiting for fixes: breqn, grffile, multimedia, movie15.

**v0.75:** keyfloat, wrapfig

- `\minipage`: Fix for `\linewidth`.

packages
- keyfloat: Improved color control.
- wrapfig: Fix for `\linewidth`.

**v0.74:** Docs, SVG math, *lwarpmk*, HTML `alt` and `title` text, lyluatex

docs
- Added to the tutorial the section What next?. See section 5.19.
- Added documentation about localization options. See section 7.1.
- Added documentation about accessibility options. See section 7.2.

HTML `alt` text
⚠ changed names
- Renamed and updated HTML `alt` text macros:

| Old | New |
|---|---|
| (hard coded as “image”) | `\ImageAltText` |
| `\mathimagename` | `\MathImageAltText` |
| `\packagediagramname` | `\PackageDiagramAltText` |

- Added `\ImageAltText` for the default HTML `alt` text for an image. See section 7.6.

- Added `\ThisAltText`, which may be used to assign a one-time HTML `alt` tag to the very next image generated by lwarp, such as a `lateximage`, `picture`, `tikzpicture`, an image generated by various chemistry or engineering packages, or an SVG math image. This macro also adds a `title` tag to a reference or hyperlink. See section 7.6.

svg math
- Adjusted `\LateximageFontScale` default from .75 to 1.
- Fix: Font control for SVG math.

misc
- Fix: Ignores negative `\hspace`.
- Warning if `SideTOCDepth` < `FileDepth`.

*lwarpmk*
- *lwarpmk*: **`lwarpmk clean`** removes additional files.
- *lwarpmk*: **`lwarpmk epstopdf`** and **`lwarpmk pdftosvg`** now honor directories.

packages
- lyluatex: Split images by `system` or per `fullpage`, improved margins and scaling.
- Tested to work as-is with mathspec, unicode-math.

**v0.73:** `\include`, memoir, koma-script, caption, xy, datatool, music scores.

- Fix for `\include`.
- Warning for a `tabular` inside a .
- `\color`: Added HTML support for rules and frames, but not inline text. Use `\textcolor` if possible.
- Improved many HTML tags, reducing *tidy* warnings. See Change History.

packages
- memoir: Fixes for `\frontmatter*` and `\mainmatter*`. Added `\book`.
- koma-script: Fix for starred captions in the TOC.
- caption: Fix for starred captions.
- datatool: Added pie, bar, and plot charts.
- threeparttable: Added `measuredfigure`.
- intopdf: Updated to v0.2.1.
- tocdata: Updated to v2.03.
- quotchap: Updated to v1.2.
- versonotes: Updated to v0.4.
- backnaur: Now uses SVG images. Updated to v3.1.
- xy: Fix for `\xybox`, improved `xy`, also now compatible with qcircuit.
- fancyvrb: Fix for label HTML tags.
- Added stackengine.

music
- Added lyluatex. (Music scores.)
- musicography: Updated to 2019/05/28. Added support for `lateximages`.

**v0.72:** Font control, `\multicolumn`, xr and xr-hyper.

⚠ images

- Due to internal changes, images for inline SVG math and `lateximages` will have new hash values, and will have to be regenerated using

  Enter ⇒ **`lwarpmk cleanlimages`**

  and

  Enter ⇒ **`lwarpmk limages`**

- Docs: Color-codes package names in the table of supported packages and features, table 2, according to each package's level of support by lwarp.
- `\multicolumn`: Fix for paragraph columns.

packages

- xr, xr-hyper: Fixes for references, `\externaldocument`.
- soulutf8: Fix: Loads soul for emulation.
- boxedminipage2e: Added support for `lateximages`.
- zhlineskip: Updated to v1.0e.
- Added fontaxes, slantsc, tabfigures.
- Added nfssext-cfr, thus supporting cfr-lm and several other font packages.
- Added backnaur, hypbmsec, minibox, pdfcrypt, shapepar.

**v0.71:** Error handling, multimedia, `tabular`.

- `tabular`: Added support for '`*`' columns. Fix for paragraph tags.
- `quotation`: Fix for HTML tag.
- Docs: Added a section about error conditions tested by lwarp. See section 13.1.
- *lwarpmk*: If file `lwarpmk.conf` is an older version, or the incorrect operating system, displays the print command to use to recompile.

packages

- chemfig: Updated for v1.4.
- endfloat: Updated for v2.7.
- textpos: Updated for v1.9.1.

multimedia

- Added media9, movie15, multimedia.

**v0.70:** Error handling, MathJax, mathtools.

- Error handling for "Label(s) changed." Refuses to **`lwarpmk limages`** until recompile first.
- Fix: If Computer Modern font is used, ensures cm-super or lmodern is used.
- Fixes for `\makebox`.
- Fixes for `\parbox` inside a `<span>`.
- MathJax: Updated to v2.7.5. Loads the `autoload-all.js` extension. Added `\MathJaxFilename` to select custom scripts.

packages

- textcomp, xunicode: Fix for `\textinterrobang`.
- mhchem: Works with MathJax. See section 397.
- changes: Updated to v3.1.2.
- Added autonum, changelayout, inputtrc, mathtools, metalogox.

**v0.69:** Error handling, many fixes, improved keyfloat/tocdata.

- Fix for HTML corruption of `lateximage` displays.
- `\makebox`, `\framebox`: Fix for (⟨*width,height*⟩) arguments.
- `fminipage`: Honors `\minipagefullwidth`.

packages

- array, longtable: Fix for `\tabularnewline`.
- tabularx, tabulary: Fix to require the array package.
- supertabular, xtab: Fix to clear caption after use.
- graphics: Added a warning if used the `\includegraphics scale` option.
- multirow: Added an error if didn't use `\mrowcell` or `\mcolrowcell` when using `\multirow` or `\multicolumnrow`.
- keyfloat: Updated for v2.00, additional improvements.
- Added ctable, eqlist, eqparbox, ftcap, listliketab, minitoc, tocdata, topcapt.

**v0.68:** Error handling, tabulars, footnotes.

*lwarpmk*

- *lwarpmk*: Improved error handling for image generation if compile was incomplete.
- `tabular`: Fix for `\warpprintonly`.

packages

- longtable: Improved flexibility for `\endhead`, etc. Improved error reporting if `\endhead`, etc. incorrect for lwarp.
- threeparttable: Fix for caption type.
- hyperref: Fix for options with braces.
- morefloats: Fix to be loaded early for print output.
- listings: Updated for v1.7.
- Added bigfoot, fnpara, footnotebackref, manyfoot, tablefootnote, threeparttablex.
- Added layouts, niceframe, perpage, showtags.
- Prevented alg, algorithmic, pdfcprot, fncylab.

**v0.67:** Filename generation, symbol fonts.

docs

- Documentation fix for `<project>-images`, `<project>-images.txt`.
- Added discussion regarding section names. See section 8.4.

filenames

- Added `\FilenameNullify` and `\FilenameSimplify` for filename generation. See section 8.4.
- Core, textcomp, xunicode: Nullified additional symbols during filename generation.

packages

- color: Fix for version number warnings.
- Added academicons, bbding, dingbat, eurosym, fontawesome, fontawesome5, marvosym, pifont, typicons.
- Added changes, easyReview, fitbox, foreign, gloss, karnaugh-map, multicap, nomencl, notes, struktex, umoline, xfakebold.
- Tested to work as-is with askmaps, curves, euro, karnaughmap, tikz-karnaugh.

**v0.66:** xr, multiple projects, image names/directory, HTML formatting

⚠ Reset the configuration

- Due to changes in *lwarpmk*, recompile any existing project a single time using **`pdflatex filename.tex`** or similar, after which *lwarpmk* may then be used with the new configuration files.

`lateximage`

- Adds options `ImagesDirectory` and `ImagesName` to assign directory and name prefixes for `lateximage` images. The new defaults include the jobname, allowing the image directories for multiple projects to coexist.

⚠ existing projects

- To reuse existing `lateximage` directories, add lwarp options

```
\usepackage[
  ImagesDirectory={lateximages},
  ImagesName={lateximage-}
]{lwarp}
```

  If not reused, the existing `lateximages` directory and `lateximages.txt` file may be removed.

filenames

- Added `\FilenameLimit` to control the maximum length of the filenames generated by lwarp.

⚠ Possible filename changes

- Improved filename generation when special characters or macros are used in section names.

WINDOWS

- Fix for **`lwarpmk cleanlimages`** with WINDOWS.

floats

- Fixes for floats in the home page.

lists, table notes

- Improved CSS for definition lists, table notes.

`tabular`

- `tabular`: Fixes for `\par` in column specifier, minipage inside `tabular`.

indexing

- Indexing: Fix for a long line of multiple entries.

`minipage`

- `\minipagefullwidth`: Fix for global changes.
- Added `\UseMinipageWidths` and `\IgnoreMinipageWidths`. See section 8.3.3.

colors

- Improved `\fbox`, `\fboxBlock`, `\fminipage` to use current text color.

HTML

- Improved HTML output formatting.

docs

- Added discussion regarding invalid HTML. See section 8.1.1.
- Added discussion regarding math in section names, `\imagegraphics scale` option. See section 6.
- Added discussion regarding international languages in section names. See section 8.14.

packages

- caption: Fix for options clash.
- xr, xr-hyper: Now compatible.
- subcaption: Improved horizontal spacing.
- multicol: Fix for minipage inside `multicols`.
- multicolrule: Updated for v1.2.
- tocbasic: Minor update.
- acronym: Fix for acronym in float caption.
- kotexutf: Patch with *pdflatex* and new lwarp labels.
- extramarks, fancyhdr: Updated for v3.10.
- memoir: Added docs regarding version numbers. See section 8.13.

- zref: No longer required.
- Added ar, ed, indentfirst, nameauth, truncate.
- Verified to work as-is with changelog.
- Prevented colortab, epsf, hyper, picinpar, picins, sistyle, ucs.

**v0.65:** CSS layout, `alt` tags, Japanese.

page layout
- Moved the sideTOC to the left side, allowing improved CSS for margin notes.
- Improved page layout CSS.

image `alt` tags
- graphicx `\includegraphics`: Added the `alt` key to assign an `alt` tag to an image. Default is "`image`", assigned to pass validation.

duplicate HTML files
- Detects and causes an error if duplicate HTML file names are generated, caused by identical or similar sectioning names.

fixes
- Fix for `tabular*`.
- Fix for tabular border colors.
- Fixes `\quad`, `\enskip`, and figure captions to pass validation.

Japanese
- Added ltj* classes, bounddvi, gentombow, lltjext, plarydshln, plext, plextarydshln, plextcolortbl, pxatbegshi, pxeveryshi, pxftnright, pxjahyper, tascmac.
- Verified to work with plarray, plautopatch, plextarray, plextdelarray, pxgentombow, plsiunitx, pxpdfpages, pxpgfrcs, pxpgfmark.

packages
- Added support for fontspec `\textsi` and `\sishape`.
- Added multicol's `\docolaction`.
- Added embrac, footnoterange, multicolrule, versonotes.

**v0.64:** Koma-Script, Japanese, Chinese.

Japanese
- Added utarticle and related classes.
- Improved ujarticle and related classes.

Chinese
- Fix for biblatex with CTEX and other classes.

Koma-Script
- Fixes for scrlayer, scrlayer-scrpage.

packages
- addlines: Updated to v0.3.
- Added bsheaders, gmeometric, marginal, rmpage, scrpage2.

**v0.63:** mdframed, Chinese, Japanese, Korean

localization
- Added `\linkhomename`: A user-definable name for the Home link.
- Documented `\sidetocname`: A user-definable name for the sideTOC.

fixes
- Fix: `\LinkHome` for print output.

optimizations
- Moved package load checks to the lwarp core to reduce the number of `lwarp-*` files.

packages
- mdframed: Fix with amsthm, improved titles and font control. Improved rule widths.

Chinese
- Fixes for xeCJK.
- Added xpinyin, zhlineskip.

- Verified to work with cjkpunct, upzhkinsoku, zhspacing.

Japanese
- Verified to work with zxjatype, luatexja, luatexja-fontspec.
- Added bxjsarticle and related classes.
- Added ltjsarticle and related classes.
- Added pLaTeX, upLaTeX, ujarticle and related classes.
- Prevented utarticle and related classes.
- Prevented bxcjkatype.

Korean
- Verified to work with kotex, xetexko, luatexko.

**v0.62:** MiKTeX docs, HTML title, CTeX, xeCJK, bitpattern.

docs
- Docs: Setting a UTF-8 locale. See section 9.8.

MiKTeX
- MiKTeX: Docs for *MiKTeX Console* and miktex-poppler-bin.

HTML <title>
- HTML subpage titles: Added `\HTMLTitleBeforeSection` and `\HTMLTitleAfterSection` to select whether the HTML `<title>` displays the website name before or after the section name. See section 7.6.

fixes
- Fix for package options handling.
- Fixes for horizontal white space between `fminipage`, `fcolorminipage`, `colorboxBlock`, `fcolorboxBlock`.
- Logos: Fix for XeTeX logo, improved CSS, made robust, improved search-engine optimization.
- `\\[$1]`: Additional HTML `<br>` if $1 > 0 pt.
- Fixes for `\includgraphics` filename, and with `FormatWP`.
- Fix: CSS for `\textup`.
- Fix: Added `\slshape`.

Chinese
- Added ctex package and related classes, xeCJK.
- Prevented CJK, CJKutf8 unless xeCJK, ctex are used.

packages
- chemfig: Docs for new macro `\polymerdelim`.
- asymptote: Docs for compilation.
- chngpage: Fix to load lwarp-changepage.
- algorithm2e: Fix with non-book classes.
- register: Updated to v1.8.
- nicefrac: Improved font control and CSS, honors `nice` and `ugly`.
- units: Improved font control and CSS, honors `tight` and `loose`.
- xfrac: Improved CSS.
- textcomp and xunicode: Fix conflicts with `\textcircled`.
- ulem: Improved compatibility with CJKulem, `lateximage`.
- MathJax and siunitx: Removed inoperable extension.
- Added bitpattern, pdfcomment, pdfmarginpar, tram, unitsdef, xechangebar.
- Added musicography, octave, semantic-markup.
- Added 2in1, flippdf, notespages, rviewport, twoup.

**v0.61:** Custom compilation, EPS-related packages, documentation, indexes.

docs
- Split index into multiple indexes.
- Improved documentation regarding font selection. See section 7.4.
- Added documentation regarding debugging options. See section 35.
- Added documentation regarding HTML entities inside program listings. See section 8.2.1.

custom compiling
- Added options to specify the shell commands to execute for **`lwarpmk print`** and **`lwarpmk html`**, allowing the use of lwarp with perltex, pythontex, etc. If not specified, these are set automatically depending on the LaTeX engine, `--shell-escape`, and lwarp options. See section 9.

⚠ changed names
- Changed macro names to match `\displaymathother`, `\displaymathnormal`:

| Old | New |
|---|---|
| `\StartDynamicMath` | `\inlinemathother` |
| `\StopDynamicMath` | `\inlinemathnormal` |

fixes
- Fix: Paragraph tags in a `tabular`.
- Fix: supertabular and xtab captions.
- Fix: DVI LaTeX `\includegraphics` EPS images.
- Fix: newfloat lists.
- Fix: CSS footnotes text align, minipage tabular and footnote margins.

packages
- Added epsfig, psfrag, psfragx, pstool.
- Added copyrightbox, pdfprivacy, thinsp, threadcol, uspace.
- Added chkfloat, cmdtrack, dprogress, lua-visual-debug, refcheck, srcltx, srctex, vpe, xbmks.

**v0.60:** Fixes for longtable, listings.

fixes
- longtable, etc.: Fixes for slowdown and memory management for very long tables.
- listings: Fix for HTML entities, and also when used inside a list.
- diagbox: Fix for incorrect HTML par tags.

packages
- Added 2up, booklet.
- Added bophook, draftfigure, fullminipage, grid-system, layaureo.
- Added leading, widows-and-orphans.
- Added fancytabs, thumb, thumbs.

**v0.59:** DVI *latex*, MathJax, asymptote, pdftricks and pstricks, epstopdf, brqen.

⚠ Reset the configuration
- Due to changes in *lwarpmk*, recompile any existing project a single time using **`pdflatex filename.tex`** or similar, after which *lwarpmk* may then be used with the new configuration files.

*lwarpmk*
- Added an error if `lwarpmk.conf`'s format has changed and the document must be recompiled.
- Added a warning if the `lwarpmk.conf` configuration file appears to be for the wrong operating system, in case files are transferred between systems.

- Added
  ```
  lwarpmk epstopdf <list-of-EPS-files>
  ```
  to quickly convert a document's EPS images to PDF or SVG. See section 8.8.

DVI *latex*
- Added support for DVI *latex*. See section 7.5.

*latexmk*
- Fix for `--shell-escape` with *latexmk*.

math
- Updated MathJax script to v2.7.4.
- Fix: MathJax chapter number removed from non-numeric tagged equations.
- Added MathJax support for nicefrac, units.
- Fix for `\[` and `\]` with `\displaymathnormal`.

images
- Fix for `\includegraphics` filename expansion.
- `\includegraphics` now works with `.pdf` and `.eps` filename extensions.

packages
- Moved amsmath out of the lwarp core.
- Fix for chemformula `\NMR`.
- Added asymptote, pdftricks, pstricks, pst-eps.
- Added breqn, SIunits.
- Added bxpapersize, canoniclayout, draftcopy, fnbreak, nccfancyhdr.
- Added accsupp, axessibility.
- Added xunicode.
- Improved and now supports epstopdf.
- Tested to work as-is: eepic, sepfootnotes.

docs
- Added information about setting up a development version of lwarp.

**v0.58:** Extensive improvements in indexing, glossaries. Adds PDF-inclusion packages.

⚠ Reset the configuration
- Due to changes in *lwarpmk*, recompile any existing project a single time using **`pdflatex filename.tex`** or similar, after which *lwarpmk* may then be used with the new configuration files.

*lwarpmk*
- *lwarpmk*: Added the `-p` option to specify the project name.

glossaries
- *lwarpmk*: Now uses *makeglossaries* for glossary generation, allowing the processing of multiple glossaries at once.
- Added lwarp option `GlossaryCmd` to specify the shell command used by **`lwarpmk printglossary`** and **`lwarpmk htmlglossary`**. Defaults to **`makeglossaries`**.

index and glossary
- Docs: Extra indexing options. See section 8.6.14.
- Added support for *makeindex*. (Previously supported only *xindy*.) Also added indexing packages listed below.
- Added lwarp options `PrintIndexCmd`, `HTMLIndexCmd`, and `LatexmkIndexCmd` to specify shell commands used by **`lwarpmk printindex`**, **`lwarpmk htmlindex`**, and *latexmk*. May be preset with the `makeindex` or `xindy` lwarp options. See section 7.5.
- Added lwarp options `makeindex` and `xindy` to set `PrintIndexCmd`, `HTMLIndexCmd`, and `LatexmkIndexCmd` to sensible values for a typical single index. See section 7.5.

- Added lwarp option `makeindexStyle` to tell *lwarpmk* to use a custom style instead of `lwarp.ist`. See section 8.6.20.
- Fix for index entries with `\see`, `\seealso`, `\emph`, `\textbf`, etc.

misc. fixes
- Replaced each `\csuse` with `\@nameuse` for improved error detection.
- Additional internal print/HTML macro selection improvements.
- Fix: `\printindex` finishes pending `\index` writes first.

packages
- Fixes for memoir: makeidx, ccaption, multiple indexes, `\specialindex`.
- Fixes for komascript: Indexing improvements.
- Added imakeidx, index, repeatindex, splitidx.
- Added attachfile, attachfile2, intopdf, pdfpages, pdfx.
- Added cases.
- Tested to work as-is: notes2bib, hvindex.

**v0.57:** algorithm2e, float styles, tabular packages, internal improvements.

MathJax
- Added support for MathJax equations with `\footnote`, `\footnotemark`.

math macros
- Added `\StartDefiningMath` and `\StopDefiningMath` for use when defining macros in the preamble which contain $. See section 8.7.7.

dynamic math
- Added `\inlinemathother` and `\inlinemathnormal` to delimit math expressions which depend on a variable condition such as a counter. Such expressions will not be hashed for reuse, and will be converted to SVG math images even when MathJax is enabled. See section 8.7.8.

⚠ new name
- Renamed `\EndDefiningTabulars` to `\StopDefiningTabulars`.

`lateximage alt` tags
- Improved localization for `lateximage` HTML `alt` tags. For SVG math images, the `alt` tag under some conditions will be set to `\MathImageAltText`, which defaults to `math image`. For packages, the `alt` tag is set using the package name followed by `\PackageDiagramAltText`, which defaults to `diagram`. Ex:

  ```
  (-xy- diagram)
  ```

  See section 7.6.
- Fix: Improved print/HTML macro selection.

misc. fixes
- Fix: `\href` text catcodes.
- Fix: `\subref` text.
- Fixes: Colored `\rule` and `\boxframe`.

packages
- float, rotfloat: Adds support for float styles `ruled` and `boxed`.
- float: Fix: Do not create `\l@<type>` until `\listof` is used.
- marginnote: Fix: Long optional argument.
- ellipsis: Adds `\midwordellipsis`.
- breakurl: Fix for text catcodes.
- Added algorithm2e, register, ltablex, xltabular, xellipsis, trimclip, errata, vowel, xpiano.
- Prevents glossary.
- Tested to work as-is with gauss, phonrule, piano, SIunits, tikzcodeblocks.

**v0.56:** Shell escape, tabular packages.

*lwarpmk*
- Added
  ```
  lwarpmk pdftosvg <list-of-PDF-files>
  ```
  to quickly convert a document's PDF images to SVG, for use with HTML. See section 8.8.
- Added support for `--shell-escape`. See section 7.3.

`tabular`
- Added support for array `w` and `W` columns.
- Fix: `\multicolumn` parameter handling.
- Added support for double `\hlines`, `\midrules`, and vertical rules.
- Added support for arydshln dashed lines with HTML `tabular`, but reverts to plain rules for `lateximage` and SVG math `array`.

misc. fixes
- Fix: `\thinspace`.
- Fix: paralist compact environments.

packages
- Added parnotes, quoting, lua-check-hyphen, tocenter, underscore.
- Added bibunits.
- Tested to work as-is with babelbib, bodegraph, fast-diagram, nicematrix, structmech.

**v0.55:** Various fixes.

misc fixes
- Fix: Extraneous space in file links, which also prevented *Calibre* EPUB conversions.
- Fix: Float optional argument regression.
- Fix: `\ForceHTMLTOC` with `\phantomsection`.
- Fix: Overfull boxes in `lateximages`.
- Fix: QED symbols in `lateximage`.

packages
- koma-script: Fix: Figure with `\centering`, etc.
- Added clrdblpg.

**v0.54:** Float `\centering`, improved image checks.

⚠ Reset the configuration
- Due to changes in *lwarpmk*, recompile any existing project a single time using **`pdflatex filename.tex`** or similar, after which *lwarpmk* may then be used with the new configuration files.

*lwarpmk*
- `lwarpmk limages` checks for the presence of the HTML version of the document and valid image references before attempting to create the `lateximages`.
- *lwarpmk*: Improved error message if configuration file does not exist.

BibTeX
- Added documentation for avoiding error with BibTeX and `\etalchar`. See section 8.6.9.

polyglossia
- Added documentation regarding polyglossia. See section 8.15.4.

macros in section names
- Added documentation regarding the use of macros in section names. See section 8.1.

document encoding
⚠ New and revised encoding options
- Renamed and added package options:

| Old Package Option | New Package Option |
|---|---|
| `xdyFilename` | `xindyStyle` |
| `IndexLanguage` | `xindyLanguage` |
| – | `xindyCodepage` |
| – | `pdftotextEnc` |

Use these options along with inputenc or inputenx to process documents in an encoding other than UTF-8. See section 7.4.

floats with `\centering`, etc.

- Floats now honor `\centering`, `\raggedright`, `\raggedleft`, and their ragged2e equivalents, when placed directly after:

```
\begin{floattype}
\centering
```

misc. fixes

- tikz: `\pgfpicture`, fit, align, font.
- ragged2e: `\centering` etc.
- hyperref: `\hypertarget` was creating duplicate of `\label`.
- hyperref: Active chars inside `\hyperref`, `\hyperlink`.
- hyperref: `\ref` inside `\hyperlink` caused a nested HTML link.
- glossaries: Fix when not using babel or polyglossia.
- textcomp: `\textperthousand`.
- LaTeX core `verse` environment: line spacing.

⚠

- Removed `\citetitle`, adjusted `\attribution`.

packages

- memoir: Minor update for v3.7g.
- Added inputenx, bibunits, chngpage, forest, magaz, gridset.
- Prevents loading ae, aecc, t1enc, and wasysym.

**v0.53:** Improved image checks.

*lwarpmk*

- *lwarpmk*: Added a warning about corrupted images due to the need to recompile the document one more time.
- *lwarpmk*: Added the **`lwarpmk cleanlimages`** command.
- Added documentation for **`lwarpmk cleanlimages`** and **`lwarpmk pdftohtml`**.

**v0.52:** Improved footnotes, SVG math.

documentation

- Improved install instructions regarding `lwarp_baseline_marker.png`.
- Added documentation regarding footnotes in section headings, and footnotes with `\VerbatimFootnotes` from fancybox, fancyvrb. See section 8.5.4.
- Added documentation regarding font selection when using XeLaTeX or LuaLaTeX with fontspec and traditional font packages. See section 7.4.

SVG math

- Fix: Limit the number of background tasks when generating `lateximages`.
- Added user-adjustable SVG math font scaling. See section 83.3.
- Added warnings if `lwarp_baseline_marker.png` is not present, or if graphicx or graphics is not loaded.
- Improved `\ensuremath` hashing expansion.

- Fix: `equation*` with `split`.
- `tabbing` now works inside a `lateximage`. Use for math in `tabbing`.

MathJax
- Fix: MathJax script was not executing in some conditions.
- Added `\CustomizeMathJax` to add custom functions. See section 8.7.

footnotes
- Fix: Footnote numbering when using `HTMLDebugComments`.
- Fix: Footnote paragraph tags.
- Fix: `FootnoteDepth` defaults to `\subsubsection`.

misc. fixes
- Fix: `\kill` in a `lateximage`.
- Fix: `\FileDepth`, misc. others, when input encoding is not `utf8`.
- Fix: `\texorpdfstring` in a section name.

packages
- hyperref emulation: Fix for #, %, &, ~, _ characters in URLs.
- fancybox, fancyvrb: Initial support for `\VerbatimFootnotes`.
- nicefrac: Added with fix for `\ensuremath`.
- graphicx: Fix for option defaults. Added v1.1a/b options.
- endfloat: Updated for v2.6.
- url: Fixes for active characters.

**v0.51:** Improved SVG math, added numerous chemistry packages.

documentation
- Docs: Added Things to avoid.
- Docs: Added to Converting an existing document.
- Docs: Multiple authors and affiliations with custom classes. See section 8.6.1.
- Docs: tikz with matrices. See section 8.8.1.

SVG math
- Improved SVG math baseline.
- Improved SVG math font and color.
- Faster SVG math rendering.
- Improved support for display math containing complicated math objects, such as tikz-cd. See section 8.7.9.
- Fix: `\addcontentsline` inside SVG math.
- Fix: SVG math containing an embedded `lateximage`.

MathJax
- MathJax now handles `\ensuremath` in expressions.

misc. fixes
- Fix: Added `alignat` environment.
- Fix: afterpackage no longer required, which conflicted with scrlfile.
- Fix: titling `\thanks` mark.
- Fix: fancybox improvements.
- Fix: tikz `\tikz` macro. (Previously only the `tikzpicture` environment worked.)
- Fix: tikz with optional argument.

packages
- Added mhchem, chemfig, chemformula, chemmacros, chemnum, chemgreek, epstopdf-base, grid, ltxgrid.

# 2 Introduction

The lwarp project aims to allow a rich LaTeX document to be converted to a reasonable HTML5 interpretation, with only minor intervention on the user's part. No attempt has been made to force LaTeX to provide for every HTML-related possibility, and HTML cannot exactly render every possible LaTeX concept. Where compromise is necessary, it is desirable to allow the print output to remain typographically rich, and compromise only in the HTML conversion.

Several "modern" features of HTML5, CSS3, and SVG are employed to allow a fairly feature-rich document without relying on the use of JavaScript. Limited testing on older browsers shows that these new features degrade gracefully.

---

lwarp is a native LaTeX package, and operates by either patching or emulating various functions. Source-level compatibility is a major goal, but occasional user intervention is required in certain cases.

As a package running directly in LaTeX, lwarp has some advantages over other methods of HTML conversion. TeX itself is still used, allowing a wider range of TeX trickery to be understood. Lua expressions are still available with LuaTeX. Entire categories of LaTeX packages work as-is when used with lwarp: definitions, file handling, utilities, internal data structures and calculations, specialized math-mode typesetting for various fields of science and engineering, and anything generating plain-text output. Blocks of PDF output may be automatically converted to SVG images while using the same font and spacing as the original print document, directly supporting Ti*k*z and `picture`. Numerous packages are easily adapted for HTML versions, either by loading and patching the originals, or by creating nullified or emulated replacements, and all without resorting to external programming. As a result, several hundred packages have already been adapted (table 2), and an uncounted number more work as-is.

Packages have been selected according to several criteria: perceived importance, popularity lists, recent CTAN updates, CTAN topics, mention in other packages, support by other HTML conversion methods, and from sample documents taken from public archives. These include some "obsolete" packages as well.[1]

---

Assistance is also provided for modifying the HTML output to suit the creation of EPUB documents, and for modifying the HTML output to ease import into a word processor.

---

*pdflatex*, *xelatex*, or *lualatex* may be used, allowing lwarp to process the usual image formats. While generating HTML output, SVG files are used in place of PDF. Other formats such as PNG and JPG are used as-is.

[1] An amazing number of decades-old packages are still in use today.

SVG images may be used for math, and are also used for `picture`, Ti*k*z, and similar environments. The SVG format has better browser and e-book support than MathML (as of this writing), while still allowing for high-quality display and printing of images (again, subject to potentially bug-ridden[2] browser support).

Furthermore, SVG images allow math to be presented with the same precise formatting as in the print version. Math is accompanied by `<alt>` tags holding the LaTeX source for the expression, allowing it to be copy/pasted into other documents.[3] Custom LaTeX macros may be used as-is in math expressions, since the math is evaluated entirely inside LaTeX. An MD5 hash is used to combine multiple instances of the same inline math expression into a single image file, which then needs to be converted to SVG only a single time.

The MathJax JavaScript display engine may be selected for math display instead of using SVG images. Subject to browser support and Internet access, MathJax allows an HTML page to display math without relying on a large number of external image files.[4] lwarp maintains LaTeX control for cross-referencing and equation numbering, and attempts to force MathJax to tag equations accordingly.

---

A *texlua* program called *lwarpmk* is used to process either the print or HTML version of the document. A few external utility programs are used to finish the conversion from a LaTeX-generated PDF file which happens to have HTML5 tags, to a number of HTML5 plain-text files and accompanying images.

lwarp automatically generates the extra files necessary for the HTML conversion, such as CSS and `.xdy` files, and configuration files for the utility *lwarpmk*. Also included is a parallel version of the user's source document, `<sourcename>-html.tex`, which selects HTML output and then inputs the user's own source. This process allows both the printed and HTML versions to co-exist side-by-side, each with their own auxiliary files.

When requesting packages during HTML conversion, lwarp first looks to see if it has its own modified version to use instead of the standard LaTeX version. These `lwarp-packagename.sty` files contain code used to emulate or replace functions for HTML output.

[2] Firefox has had an on-again/off-again bug for quite some time regareding printing SVGs at high resolution.

[3] There seems to be some debate as to whether MathML is actually an improvement over LaTeX for sharing math. The author has no particular opinion on the matter, except to say that in this case LaTeX is much easier to implement!

[4] One SVG image file per math expression, except that duplicate inline math expressions are combined into a single file according to the MD5 hash function of its contents. A common scientific paper can easily include several thousand files, and in one case the MD5 hash cut the number of files in half and the rendering time by 30%.

## 2.1 Typesetting conventions

Font weight, family, and style are used to indicate various objects:

Table 1: Typesetting conventions

| | |
|---|---|
| package | LaTeX package. |
| *program* | Program's executable name. |
| `option` | Program or package option. |
| `filename` | File name in the operating system. |
| Brand Name | Proper name for a program, operating system, etc. |
| **commands** | Commands to be entered by the user. |
| `code` | Program code. |
| `\macroname` | LaTeX macro. |
| `environment` | LaTeX environment. |
| `counter` | LaTeX counter. |
| `boolean` | LaTeX boolean. |
| `<element>` | HTML element. |
| `attribute` | HTML attribute. |
| User Interface | A user-interface item. |
| acro | Acronym. |

## 2.2 Supported packages and features

Table 2 lists some of the various LaTeX features and packages which may be used.

Package names are colored according to their support level:

name: Supported as-is.

name: Modifed to work with HTML output, and perhaps also as print output in SVG math or `latexmage` environments.

name: Emulated for HTML output.

name: Ignored for HTML output, but provides source-level compatibility.

MJ: Supported as-is for MathJax, subject to limitations.

MJ: Emulated for MathJax using custom macros, subject to limitations.

MJ: Ignored by MathJax, but may be used in the document source. May be converted to SVG images.

Table 2: LaTeX lwarp package — Supported features

| Category | Status and supported features. |
|---|---|
| Engines: | DVI LaTeX, pdfLaTeX, XeLaTeX, LuaLaTeX, upLaTeX |
| Compiling: | *latexmk*, *perltex*, *pythontex*, *make*, etc. |
| Classes: | article, book, report, scrartcl, scrbook, scrreprt, memoir, CJK-related as listed below. |
| Koma-script: | scrextend, scrhack, scrlayer. Others as listed below. |
| Memoir: | memhfixc |
| Languages: | babel, cjkpunct, impnattypo, luavlna, polyglossia, xeCJK, xevlna. |
| Chinese: | CTeX, ctex, upzhkinsoku, xpinyin, zhlineskip, zhspacing. |
| Japanese: | upLaTeX, LuaTeX-ja, gentombow, lltjext, plarray, plarydshln, plautopatch, plext, plextarray, plextarydshln, plextcolortbl, plextdelarray, pxatbegshi, pxeveryshi, pxftnright, pxgentombow, pxjahyper, pxpdfpages, pxpgfrcs, pxpgfmark, tascmac, zxjatype. bxjsarticle and related, ltjsarticle and related, luatexja, luatexja-fontspec, ujarticle and related, utarticle and related. |
| Korean: | kotex, luatexko, xetexko. |

lwarp Supported Functions — continued

| Category | Status |
|---|---|
| Page layout: | 2in1, 2up, a4, a4wide, a5comb, addlines, anysize, atbegshi, blowup, booklet, bophook, bounddvi, bxpapersize, canoniclayout, changelayout, changepage, chngpage, clrdblpg, continue, draftcopy, draftfigure, draftwatermark, ebook, everyshi, fancyhdr, fancytabs, flippdf, fullminipage, fullpage, fwlw, geometry, gmeometric, grid, grid-system, gridset, layaureo, layout, layouts, leading, ltxgrid, nccfancyhdr, notespages, nowidow, pagegrid, pagesel, parallel, parcolumns, pdfcolparallel, pdfcolparcolumns, pdfcrypt, pdfprivacy, preview, ragged2e, returntogrid, rmpage, scrlayer-scrpage, scrpage2, setspace, selectp, textarea, threadcol, thumb, thumbs, titleps, tocenter, turnthepage, twoup, typearea, underlin, vmargin, watermark, widows-and-orphans, zwpagelayout. |
| Sectioning: | Adds `FileDepth` for splitting the HTML output. Files may be numbered sequentially or named according to section name. Common short words and punctuation are removed from the filenames. anonchap, bsheaders, fncychap, hypbmsec, indentfirst, quotchap, section, sectionbreak, secdot, sectsty, titlesec, tocvsec2. |
| Table of contents, figures, tables: | Supported, with hyperlinks. etoc, minitoc, multitoc, shorttoc, tableof, titletoc, tocbasic, tocbibind, tocdata, tocloft, tocstyle, tocvsec2. |
| Title page: | `\maketitle`, `titlepage`, authblk, authoraftertitle, titling. |
| Front & back matter: | abstract, appendix. |
| Indexing: | *makeindex*, *xindy*, and *xindex* are supported, with hyperlinks.<br>gindex, hvindex, idxlayout, imakeidx, index, makeidx, repeatindex, splitidx, varindex, xindex. |
| Glossary: | gloss, glossaries and *xindy*, nomencl. |
| Bibliography: | babelbib, bibtopic, backref, biblatex, bibunits, chapterbib, cite, citeref, collref, drftcite, hypernat, jurabib, mcite, mciteplus, multibib, natbib, notes2bib, splitbib, showtags. |

lwarp Supported Functions — continued

| Category | Status |
|---|---|
| Cross-references: | bookmark, breakurl, cleveref, fancyref, hypdestopt, hyperref, perpage, prettyref, titleref, url, varioref, xcite, xr, xr-hyper, xurl, zref. |
| Margin notes: | marginal, marginfit, marginfix, scrlayer-notecolumn, versonotes. |
| Footnotes: | Adds `FootnoteDepth` to print footnotes at section breaks. MathJax emulation for `\footnote`, and also as marked in the following: bigfoot, dblfnote, endheads, endnotes[MJ], fixfoot, fnbreak, fnpara, fnpos, footmisc, footnote, footnotebackref, footnoterange, footnpag, manyfoot, marginnote[MJ], nccfoots[MJ], pagenote[MJ], parnotes[MJ], pdfcolfoot, pfnote, sepfootnotes, sidenotes[MJ], tablefootnote. |
| Math: | Converted to SVG images with HTML `<alt>` tags containing the LaTeX source for the math expression. MathJax supported as an alternative. amsmath[MJ]: $\mathcal{AMS}$ environments are supported. User-defined macros are available during converson, due to native LaTeX processing. |
| Theorems: | Native LaTeX theorems, amsthm, apxproof, ntheorem, shadethm, theorem, thmbox, thmtools. |

# 3 Alternatives

Summarized below are several other ways to convert a LaTeX or other document to HTML. Where an existing LaTeX document is to be converted to HTML, lwarp may be a good choice. For new projects with a large number of documents, it may be worth investigating the alternatives before decided which path to take.

## 3.1 internet class

Cls internet The closest to lwarp in design principle is the `internet` class by Andrew Stacey — an interesting project which directly produces several versions of markdown, and also HTML and EPUB. https://github.com/loopspace/latex-to-internet

## 3.2 TeX4ht

Prog TeX4ht http://tug.org/tex4ht/

Prog htlatex

This system uses native LaTeX processing to produce a DVI file containing special commands, and then uses additional post-processing for the HTML conversion by way of numerous configuration files. In some cases lwarp provides a better HTML conversion, and it supports a different set of packages. TeX4ht produces several other forms of output beyond HTML, including ODT and a direct path to EPUB, and is still being developed.

## 3.3 Translators

These systems use external programs to translate a subset of LaTeX syntax into HTML. Search for each on CTAN (http:\ctan.org).

Prog Hevea **HeVeA:** http://hevea.inria.fr/ (not on CTAN)

Prog TtH **TtH:** http://hutchinson.belmont.ma.us/tth/

Prog GELLMU **GELLMU:** http://www.albany.edu/~hammond/gellmu/

Prog LaTeXML **LaTeXML:** http://dlmf.nist.gov/LaTeXML/

Prog Plastex **PlasTeX:** https://github.com/tiarno/plastex

Prog LaTeX2HTML **LaTeX2HTML:** http://www.latex2html.org/
and http://ctan.org/pkg/latex2html.

Prog TeX2page **TeX2page:** http://ds26gte.github.io/tex2page/index.html

Finally, GladTeX may used to directly insert LaTeX math into HTML:

Prog GladTeX **GladTeX:** http://humenda.github.io/GladTeX/

## 3.4 AsciiDoc and Asciidoctor

AsciiDoc is one of the most capable markup languages, providing enough features to produce the typical technical-writing document with cross-references, and it writes LaTeX and HTML.

Prog AsciiDoc **Asciidoctor:** http://asciidoctor.org/ (More active.)

Prog AsciiDoctor **AsciiDoc:** http://asciidoc.org/ (The original project.)

### 3.4.1 Asciidoctor-LaTeX

The Asciidoctor-LaTeX project is developing additional LaTeX-related features.

**Asciidoctor-LateX:**
http://www.noteshare.io/book/asciidoctor-latex-manual
Prog Asciidoctor-LaTeX https://github.com/asciidoctor/asciidoctor-latex

## 3.5 Pandoc

Prog Pandoc A markup system which also reads and writes LaTeX and HTML.

**Pandoc:** http://pandoc.org/

(Watch for improvements in cross-references to figures and tables.)

## 3.6 Word processors

Prog Word
Prog LibreOffice
Prog OpenOffice

It should be noted that the popular word processors have advanced through the years in their abilities to represent math with a LaTeX-ish input syntax, unicode math fonts, and high-quality output, and also generate HTML with varying success. See recent developments in Microsoft ® *Word* ® and LibreOffice ™ *Writer*.

## 3.7 Commercial systems

Prog Adobe
Prog FrameMaker
Prog InDesign
Prog Flare
Prog Madcap

Likewise, several professional systems exist whose abilities have been advancing in the areas of typesetting, cross-referencing, and HTML generation. See Adobe ® *FrameMaker* ®, Adobe *InDesign* ®, and Madcap *Flare* ™.

## 3.8 Comparisons

AsciiDoc, Pandoc, and various other markup languages typically have a syntax which tries to be natural and human-readable, but the use of advanced features tends to require many combinations of special characters, resulting in a complicated mess of syntax. By

contrast, LaTeX spells things out in readable words but takes longer to type, although integrated editors exist which can provide faster entry and a graphic user interface. For those functions which are covered by the typical markup language it is arguable that LaTeX is comparably easy to learn, while LaTeX provides many more advanced features where needed, along with a large number of pre-existing packages which provide solutions to numerous common tasks.

Text-based document-markup systems share some of the advantages of LaTeX vs. a typical word processor. Documents formats are stable. The documents themselves are portable, work well with revision control, do not crash or become corrupted, and are easily generated under program control. Formatting commands are visible, cross-referencing is automatic, and editing is responsive. Search/replace with regular expressions provides a powerful tool for the manipulation of both document contents and structure. Markup systems and some commercial systems allow printed output through a LaTeX back end, yielding high-quality results especially when the LaTeX template is adjusted, but they lose the ability to use LaTeX macros and other LaTeX source-document features.

The effort required to customize the output of each markup system varies. For print output, LaTeX configuration files are usually used. For HTML output, a CSS file will be available, but additional configuration may require editing some form of control file with a different syntax, such as XML. In the case of lwarp, CSS is used, and much HTML output is adjusted through the usual LaTeX optional macro parameters, but further customization may require patching LaTeX code.

The popular word processors and professional document systems each has a large base of after-market support including pre-designed styles and templates, and often include content-management systems for topic reuse.

# 4 Installation

Table 3 shows the tools which are used for the LaTeX to HTML conversion. In most cases, these will be available via the standard package-installation tools.

Detailed installation instructions follow.

Table 3: Required software programs

**Provided by your LaTeX distribution:**

From TeXLive: http://tug.org/texlive/.

**LaTeX:** *pdflatex*, *xelatex*, or *lualatex*.

**The lwarp package:** This package.

**The *lwarpmk* utility:** Provided along with this package. This should be an operating-system executable in the same way that *pdflatex* or *latexmk* is. It is possible to have the lwarp package generate a local copy of *lwarpmk* called `lwarpmk.lua`. See table 4.

***luatex*:** Used by the *lwarpmk* program to simplify and automate document generation.

***xindy*:** The *xindy* program is used by lwarp to create indexes. On a MiKTeX system this may have to be acquired separately, but it is part of the regular installer as of mid 2015.

***latexmk*:** Optionally used by *lwarpmk* to compile LaTeX code. On a MiKTeX system, *Perl* may need to be installed first.

***pdfcrop*:** Used to pull images out of the LaTeX PDF.

**Poppler PDF utilities:**

***pdftotext*:** Used to convert PDF to text.

***pdfseparate*:** Used to pull images out of the LaTeX PDF.

***pdftocairo*:** Used to convert images to SVG.

These might be provided by your operating-system package manager, and MiKTeX provides miktex-poppler-bin-* packages.

From Poppler: poppler.freedesktop.org.

For MacOS®, see https://brew.sh/, install *Homebrew*, then

Enter ⇒ **`brew install poppler`**

For Windows, see MikTeX miktex-poppler-bin-*, or:
https://sourceforge.net/projects/poppler-win32/ and:
http://blog.alivate.com.au/poppler-windows/

***Perl*:**

This may be provided by your operating-system package manager, and may be required for some of the Poppler PDF utilities.

strawberryperl.com (recommended), perl.org

**Automatically downloaded from the internet as required:**

**MathJax:** Optionally used to display math. From: mathjax.org

## 4.1 Installing the lwarp package

There are several ways to install lwarp. These are listed here with the preferred methods listed first:

**Pre-installed:** Try entering into a command line:

Enter ⇒ **`kpsewhich lwarp.sty`**

If a path to `lwarp.sty` is shown, then lwarp is already installed and you may skip to the next section.

**TEX Live:** If using a TEX Live distribution, try installing via *tlmgr*:

Enter ⇒ **`tlmgr install lwarp`**

**MiKTEX:**

1. For newer versions of MiKTEX, install or update lwarp using the *MiKTeX Console* program.
2. For older versions of MiKTEX, to install lwarp the first time, use the *MiKTeX Package Manager (Admin)*. To update lwarp, use *MiKTeX Update (Admin)*.
3. Either way, also update the package miktex-misc, which will install and update the *lwarpmk* executable.

**Operating-system package:** The operating-system package manager may already have lwarp, perhaps as part of a set of TEX-related packages.

**CTAN TDS archive:** lwarp may be downloaded from the Comprehensive TEX Archive:

1. See http://ctan.org/pkg/lwarp for the lwarp package.
2. Download the TDS archive: `lwarp.tds.zip`
3. Find the TEX `local` directory:

   **TEX Live:**

   Enter ⇒ **`kpsewhich -var-value TEXMFLOCAL`**

   **MiKTEX:**

   In the Settings window, Roots tab, look for a local TDS root.

   This should be something like:

   ```
   /usr/local/texlive/texmf-local/
   ```

4. Unpack the archive in the TDS local directory.
5. Renew the cache:

   Enter ⇒ **`mktexlsr`**

   — or —

   Enter ⇒ **`texhash`**

   Or, for WINDOWS MiKTEX, start the program called *MiKTeX Settings (Admin)* and click on the button called Refresh FNDB.

**CTAN `.dtx` and `.ins` files:** Another form of TEX package is `.dtx` and `.ins` source files. These files are used to create the documentation and `.sty` files.

1. See http://ctan.org/pkg/lwarp for the lwarp package.
2. Download the zip archive `lwarp.zip` into your own `lwarp` directory.
3. Unpack `lwarp.zip`.
4. Locate the contents `lwarp.dtx` and `lwarp.ins`
5. Create the `.sty` files:

   Enter ⇒ **`pdflatex lwarp.ins`**
6. Create the documentation:

```
pdflatex lwarp.dtx  (several times)
makeindex -s gglo.ist -o lwarp.gls lwarp.glo
makeindex -s gind.ist lwarp.idx
pdflatex lwarp.dtx  (several times)
```

7. Copy the `.sty` files somewhere such as the TEX Live local tree found in the previous CTAN TDS section, under the subdirectory:

   `<texlocal>/tex/latex/local/lwarp`
8. Copy `lwarp_baseline_marker.png` and `lwarp_baseline_marker.eps` to the same place as the `.sty` files.
9. Copy the documentation `lwarp.pdf` to a `source` directory in the local tree, such as:

   `<texlocal>/doc/local/lwarp`
10. Renew the cache:

    Enter ⇒ **`mktexlsr`**

    — or —

    Enter ⇒ **`texhash`**

    Or, for WINDOWS MiKTEX, start the program called *MiKTeX Settings (Admin)* and click on the button called Refresh FNDB.
11. See section 4.2.1 to generate your local copy of *lwarpmk*.
12. Once the local version of `lwarpmk.lua` is installed, it may be made available system-wide as per section 4.2.

**Project-local CTAN `.dtx` and `.ins` files:** The `.dtx` and `.ins` files may be downloaded to a project directory, then compiled right there, alongside the document source files. The resultant `*.sty` and `lwarpmk.lua` files may be used as-is, so long as they are in the same directory as the document source. The files `lwarp_baseline_marker.png` and `lwarp_baseline_marker.eps` must also be copied as well. This approach is especially useful if you would like to temporarily test lwarp before deciding whether to permanently install it.

Just testing!

## 4.2 Installing the *lwarpmk* utility

(Note: If *lwarpmk* is not already installed, it is easiest to use a local copy instead of installing it system-wide. See section 4.2.1.)

After the lwarp package is installed, you may need to setup the *lwarpmk* utility:

1. At a command line, try executing **`lwarpmk`**. If the *lwarpmk* help message appears, then *lwarpmk* is already set up. If not, it is easiest to generate and use a local copy. See section 4.2.1.

2. For MiKTEX, try updating the miktex-misc package. This may install the *lwarpmk* executable for you.

   Otherwise, continue with the following:

3. Locate the file `lwarpmk.lua`, which should be in the `scripts` directory of the TDS tree. On a TEX Live or MiKTEX system you may use

   Enter ⇒ **`kpsewhich lwarpmk.lua`**

   (If the file is not found, you may also generate a local copy and use it instead. See section 4.2.1.)

4. Create *lwarpmk*:

   **Unix:** Create a symbolic link and make it executable:

   (a) Locate the TEX Live binaries:

   Enter ⇒ **`kpsewhich -var-value TEXMFROOT`**

   This will be something like:

   `/usr/local/texlive/<year>`

   The binaries are then located in the `bin/<arch>` directory under the root:

   `/usr/local/texlive/<year>/bin/<architecture>/`

   In this directory you will find programs such as *pdflatex* and *makeindex*.

   (b) In the binaries directory, create a new symbolic link from the binaries directory to `lwarpmk.lua`:

   Enter ⇒ **`ln -s <pathtolwarpmk.lua> lwarpmk`**

   (c) Make the link executable:

   Enter ⇒ **`chmod 0755 lwarpmk`**

   **Windows TEX Live:** Create a new `lwarpmk.exe` file:

   (a) Locate the TEX Live binaries as shown above for Unix.

   (b) In the binaries directory, make a *copy* of `runscript.exe` and call it `lwarpmk.exe` This will call the copy of `lwarpmk.lua` which is in the `scripts` directory of the distribution.

   **Windows MiKTEX:** Create a new `lwarpmk.bat` file:

   (a) Locate the MiKTEX binaries. These will be in a directory such as:

   `C:\Program Files\MiKTeX 2.9\miktex\bin\x64`

   In this directory you will find programs such as `pdflatex.exe` and `makeindex.exe`.

   (b) Create a new file named `lwarpmk.bat` containing:

   ```
   texlua "C:\Program Files\MiKTeX 2.9\scripts\lwarp\lwarp.texlua" %*
   ```

   This will call the copy of `lwarpmk.lua` which is in the `scripts` directory of the distribution.

### 4.2.1 Using a local copy of *lwarpmk*

It is also possible to use a local version of *lwarpmk*:

1. When compiling the tutorial in section 5, use the `lwarpmk` option for the lwarp package:

   ```
   \usepackage[lwarpmk]{lwarp}
   ```

2. When the tutorial is compiled with *pdflatex*, the file `lwarpmk.lua` will be generated along with the other configuration files.

3. `lwarpmk.lua` may be used for this project:

   **Unix:**

   (a) Make `lwarpmk.lua` executable:
   Enter ⇒ **`chmod 0755 lwarpmk.lua`**

   (b) Compile documents with
   Enter ⇒ **`./lwarpmk.lua html`**
   Enter ⇒ **`./lwarpmk.lua print`**
   etc.

   (c) It may be useful to rename or link to a version without the `.lua` suffix.

   **Windows:**

   Compile documents with either of the following, depending on which command shell is being used:
   Enter ⇒ **`texlua lwarpmk.lua html`**
   Enter ⇒ **`texlua lwarpmk.lua print`**
   etc.

   Or:
   Enter ⇒ **`lwarpmk html`**
   Enter ⇒ **`lwarpmk print`**
   etc.

## 4.3 Installing additional utilities

**To test for the existence of the additional utilities:**

Enter the following in a command line. If each programs' version is displayed, then that utility is already installed. See table 3 on page 77.

Enter ⇒ **`luatex --version`**
Enter ⇒ **`xindy --version`**
Enter ⇒ **`latexmk --version`**
Enter ⇒ **`perl --version`**
Enter ⇒ **`pdfcrop --version`**
Enter ⇒ **`pdftotext -v`**
Enter ⇒ **`pdfseparate --version`**
Enter ⇒ **`pdftocairo -v`**

**To install *xindy*, *latexmk*, and *pdfcrop*:**

The TEX utilities *xindy*, *latexmk*, and *pdfcrop* may be installed in *TexLive* with *tlmgr*, installed by *MiKTeX*, provided by your operating system's package manager, or downloaded from the *CTAN* archive:

http://ctan.org/pkg/xindy
http://ctan.org/pkg/latexmk
http://ctan.org/pkg/pdfcrop

Prog [requirement] pdftotext
Prog [requirement] pdfseparate
Prog [requirement] pdftocairo

**To install the Poppler utilities to a Unix/Linux system:**

The tools from the Poppler project should be provided by your operating system's package manager.

**To install the Poppler utilities to a MacOS machine:**

1. Install *Homebrew* from https://brew.sh/:

```
/usr/bin/ruby -e "$(curl -fsSL https://raw.githubusercontent.com/Homebrew/install/master/install)"
```
Enter

2. Install the Poppler utilities:

Enter ⇒ `brew install poppler`

**To install the Poppler utilities to a Windows machine:**

If using MikTeX, install a miktex-poppler-bin-* package. Otherwise:

1. See table 3 on page 77.
2. Download and extract the Poppler utilities *pdftotext*, *pdfseparate*, and *pdfseparate* to a directory, such as `Poppler`.
3. In the Start window, type "Path" to search for results related to Path. Or, open the control panel and search for "Path".
4. Choose Edit the system environment variables in the control panel.
5. Choose the Environment Variables button.
6. Choose the Path variable, then the Edit button.
7. Choose the New button to make an additional entry.
8. Enter the `bin` directory of the Poppler utilities, such as:

   `C:\Users\<myname>\Desktop\Poppler\poppler-0.5_x86\poppler-0.5\bin`

   Be sure to include `\bin`.
9. Click Ok when done.

Prog [requirement] perl

**To install Perl to a Windows machine:**

1. Download and install a version of Perl, such as Strawberry Perl, to a directory without a space in its name, such as `C:\Strawberry`.
2. Edit the Path as seen above for the Poppler utilities.
3. Enter the `bin` directory of the *perl* utility, such as:

   `C:\Strawberry\perl\bin`

   Be sure to include `\bin`.
4. Click Ok when done.

**Any utilities installed by hand must be added to the PATH.**

# 5 Tutorial

This section shows an example of how to create an lwarp document.

Need help?

See the General Index for "how-to", and the Troubleshooting Index if something doesn't work. A Troubleshooting section is also available. The Index of Objects contains automated entries for each package, macro, environment, counter, boolean, and other objects; individually and also sorted by category.

## 5.1 Starting a new project

1. Create a new project directory called `tutorial`.

File `tutorial.tex`

2. Inside the `tutorial` directory, create a new file called `tutorial.tex`. This may be done several ways:

   **Copy from the documentation PDF:**

   A listing is in fig. 1, which may be copied/pasted from the figure directly into your own editor, depending on the quality of the PDF viewer and editor, or:

   **Copy from the lwarp documentation directory:**

File `lwarp_tutorial.txt`

⚠ Note: `.txt` suffix!

   Another copy may be found by entering into a command line:

   Enter ⇒ **`texdoc -l lwarp_tutorial.txt`**

   This should be in the `doc/latex/lwarp/` directory along with this PDF documentation. Copy `lwarp_tutorial.txt` directly into your `tutorial` directory, renamed as `tutorial.tex`.

⚠ Bad formatting!

   *When using Windows, use an editor other than Notepad, since Notepad does not accept the end-of-line from a Unix text file.*

3. Compile the project:

   Enter ⇒ **`pdflatex tutorial.tex`**

   (several times)

   (*xelatex* or *lualatex* may be used as well. lwarp also supports DVI *latex* for use with `.eps` images.)

4. View the resulting `tutorial.pdf` with a PDF viewer.

A number of new files are created when `tutorial.tex` is compiled, as shown in table 4. These files are created by the `lwarp` package.

(Two of the new files are configuration files for the helper program *lwarpmk*. Whenever a print version of the document is created, the configuration files for *lwarpmk* are updated to record the operating system, LaTeX engine (*latex*, *pdflatex*, *xelatex*, or *lualatex*), the filenames of the source code and HTML output, and whether the additional helper program *latexmk* will be used to compile the document.)

Table 4: Configuration files created by print version

**tutorial.pdf:** The PDF output from LaTeX. The print version of the document.

**tutorial_html.tex:** A small `.tex` file used to create a parallel HTML version of the document, which co-exists with usual the PDF version, and which will have its own auxiliary files. In this way, both PDF and HTML documents may co-exist side-by-side.

**Auxiliary files:** The usual LaTeX files `.aux`, `.log`, `.out`, `.toc`, `.lof`, `.idx`. When an HTML version of the document is created, `_html` versions of the auxiliary files will also be generated.

**lwarpmk.conf:** A configuration file for *lwarpmk*, which is used to automate the compilation of PDF or HTML versions of the document.

**tutorial.lwarpmkconf:** Another configuration file used by *lwarpmk*, which is only useful if you wish to have several projects residing in the same directory.

**.css files:** `lwarp.css`, `lwarp_formal.css`, `lwarp_sagebrush.css` These files are standard for lwarp, and are not meant to be modified by the user.

**sample_project.css:** An example of a user-customized CSS file, which may be used for project-specific changes to the lwarp defaults.

**lwarp.ist:** Used by lwarp while creating an index using *makeindex*. This file should not be modified by the user. A custom file may be used instead, if necessary.

**lwarp.xdy:** Used by lwarp while creating an index using *xindy*. This file should not be modified by the user. A custom file may be used instead, if necessary.

**lwarp_one_limage.txt:** For Windows only. Used to process SVG images in the background. Copied to `lwarp_one_limage.cmd` when images are generated.

**lwarp_mathjax.txt:** Inserted into the HTML files when MathJax is used to display math. Do not modify, see `\MathJaxFilename` instead.

**comment_*.cut:** Temporary files used by lwarp to conditionally process blocks of text. These files may be ignored.

---

When the `lwarpmk` option is given to the lwarp package:

**lwarpmk.lua:** A local copy of the *lwarpmk* utility.

On Unix-related operating systems this file must be made executable:

```
chmod u+x lwarpmk.lua
```

This may be useful to have to archive with a project for future use.

## 5.2 Compiling the print version with *lwarpmk*

The *lwarpmk* utility program is used to compile either the printed or the HTML version of the document.

`lwarpmk print` is used to recompile a printed version of the document.

1. Re-compile the print version:

   Enter ⇒ **`lwarpmk print`**

   *lwarpmk* prints an introduction then checks to see if the document must be recompiled. If it seems that the files are up-to-date, then *lwarpmk* informs you of that fact and then exits.

2. Make a small change in the original document, such as adding a space character.

3. Recompile again.

   Enter ⇒ **`lwarpmk print`**

   The document is recompiled when a change is seen in the source. Several compilations may be necessary to resolve cross-references.

4. Force a recompile to occur.

   Enter ⇒ **`lwarpmk again`**

   Enter ⇒ **`lwarpmk print`**

   `lwarpmk again` updates the date code for the file, triggering a recompile the next time the document is made.[5]

5. Process the index.[6] [7]

   Enter ⇒ **`lwarpmk printindex`**

6. Recompile again to include the index.

   Enter ⇒ **`lwarpmk print`**

7. To force a single recompile when needed, even if no changes were detected:

   Enter ⇒ **`lwarpmk print1`**

Note that the HTML customization commands are ignored while making the print version.

[5] Although, when using the utility *latexmk* (introduced later), the changed date is ignored and an actual change in contents must occur to cause a recompile.

[6] The command **`lwarpmk printglossary`** is also available to process a glossary produced with the glossaries package. See section 8.6.12.

[7] Also see section 8.6.15 for index options.

## 5.3 Compiling the HTML version with *lwarpmk*

`lwarpmk html` is used to recompile an HTML version of the document.

1. Compile the HTML version:

   Enter ⇒ **`lwarpmk html`**

   (a) *lwarpmk* uses LaTeX to process `tutorial_html.tex` to create `tutorial_html.pdf`.

   (b) *pdftotext* is then used to convert to the file `tutorial_html.html`. This file is a plain-text file containing HTML tags and content for the entire document.

   (c) *lwarpmk* manually splits `tutorial_html.html` into individual HTML files according to the HTML settings. For this tutorial, the result is `tutorial.html` (the home page), along with `First-chapter.html`[8], `Some-math.html`, and the document's index in `_Index.html`.[9]

2. View the HTML page in a web browser.

   Open the file `tutorial.html` in a web browser.

   math Note that math is still displayed as its `alt` tag, which is the plain-text LaTeX source, until the images of the math expressions have been generated. Math may be displayed as SVG images or by a MathJax script, as seen in sections 5.4 and 5.5.

3. Force a recompile:

   Enter ⇒ **`lwarpmk again`**

   Enter ⇒ **`lwarpmk html`**

   Enter ⇒ **`lwarpmk print`**

4. Process the HTML index and recompile:[10][11]

   Enter ⇒ **`lwarpmk htmlindex`**

   Enter ⇒ **`lwarpmk html`**

   `_Index.html` is updated for the new LaTeX index.

5. Reload the web page to see the added index.

6. To force a single recompile when needed, even if no changes were detected:

   Enter ⇒ **`lwarpmk html1`**

[8] `First-chapter.html` also contains the first section, even though the second section is its own HTML page. This behavior is controlled by the boolean `CombineHigherDepths`.

[9] `index.html` is commonly used as a homepage, so the document index is in `_Index.html`.

[10] The command **`lwarpmk htmlglossary`** is also available to process a glossary produced with the glossaries package. See section 8.6.12.

[11] Also see section 8.6.15 for index options.

## 5.4 Generating the SVG images

math as SVG images

By default lwarp represents math as SVG images, with the LaTeX source included in `alt` attributes. In this way, the math is displayed as it was drawn by LaTeX, and the LaTeX source may be copied and pasted into other documents.

`picture` and Ti*k*z

lwarp uses the same mechanism for `picture` and Ti*k*z environments.

1. Create the SVG images:

   Enter ⇒ **`lwarpmk limages`**

   Enter ⇒ **`lwarpmk html`**

2. Move to the tutorial's HTML math page and reload the document in the browser.
3. The math images are displayed using the same font and formatting as the printed version.
4. Copy/paste a math expression into a text editor to see the LaTeX source.

⚠ adding/removing

When a math expression, `picture`, or Ti*k*z environment is added or removed, the SVG images must be re-created by entering **`lwarpmk limages`** to maintain the proper image-file associations. Inline SVG math may be hashed and thus not need to be recreated, but display math and objects such as Ti*k*z may move to new image numbers when the document is changed.

recompile first

Before attempting to create the SVG image files, *lwarpmk* verifies that the HTML version of the document exists and has correct internal image references.[12] If it is necessary to recompile the document's HTML version one more time, *lwarpmk* usually will inform the user with an error message, but there are some conditions which cannot be detected, so the user should watch for the LaTeX recompile warnings.

⚠ HTML instead of images

If HTML appears where an SVG image should be, recompile the document one more time to get the page numbers back in sync, then remake the images one more time.

⚠ page counter

Incorrect SVG images will also occur if the document changes the page counter:

```
\setcounter{page}{<value>}
```

The page counter must *not* be adjusted by the user.

⚠ Lots of files!

Expressing math as SVG images has the advantage of representing the math exactly as LaTeX would, but has the disadvantage of requiring an individual file for each math expression. For inline math, and some other objects, lwarp uses an MD5 hash on its LaTeX source to combine multiple instances of identical inline expressions into a single image file, but display math and other environments such as `picture` and Ti*k*z require one image file each. For a document with a large amount of math, see section 5.5 to use MathJax instead.

[12] This becomes important when dealing with a document containing thousands of images.

## 5.5 Using MathJax for math

math with MathJax

Math may also be represented using the MathJax Javascript project.

1. In the tutorial's source code, uncomment the `mathjax` package option for lwarp:

   ```
   mathjax, % Use MathJax to display math.
   ```

2. Recompile

   Enter ⇒ **`lwarpmk html`**

3. Reload the math page.

⚠ MathJax requirements

MathJax requires web access unless a local copy of MathJax is available, and it also requires that Javascript is enabled for the web page. The math is rendered by MathJax. Right-click on math to see several options for rendering, and for copying the LaTeX source.

While using MathJax has many advantages, it may not be able to represent complex expressions or spacing adjustments as well as LaTeX, and it may not support some math-related packages.

## 5.6 Changing the css style

For a formal CSS style, add to the preamble:

```
\usepackage{lwarp}
. . .
\CSSFilename{lwarp_formal.css}
. . .
\begin{document}
```

For a modern CSS style, `lwarp_sagebrush.css` is also provided:

```
\CSSFilename{lwarp_sagebrush.css}
```

See section 7.7 for more information about modifying the CSS styling of the document.

## 5.7 Customizing the HTML output

A number of settings may be made to control the HTML output, including filename generation, automatic compilation, math output, document splitting, meta data, and page headers and footers.

See section 7.6 for more information.

## 5.8 Using *latexmk*

*latexmk* is a LaTeX utility used to monitor changes in source files and recompile as needed.

1. In the tutorial's source code uncomment the `latexmk` option for the lwarp package:

   ```
   latexmk, % Use latexmk to compile.
   ```

2. Recompile the printed version of the document.

   Enter ⇒ **`lwarpmk print`**

   lwarp updates its own configuration files (`lwarpmk.conf` and `tutorial.lwarpmkconf`) whenever the printed version of the document is compiled. These configuration files remember that *lwarpmk* should use *latexmk* to compile the document.

3. Recompile the document.

   Enter ⇒ **`lwarpmk print`**

   and/or

   Enter ⇒ **`lwarpmk html`**

Changes are detected by comparing checksums rather than modification times, so `lwarpmk again` will not trigger a recompile, but *latexmk* has a much better awareness of changes than the *lwarpmk* utility does and it is likely to correctly know when to recompile. A recompile may be forced by making a small change to the source, and a single recompile may be forced with:

forced single-pass recompile

Enter ⇒ **`lwarpmk print1`**

and/or

Enter ⇒ **`lwarpmk html1`**

## 5.9 Using XeLaTeX or LuaLaTeX

XeLaTeX or LuaLaTeX may be used instead of LaTeX.

1. Remove the auxiliary files for the project:

   Enter ⇒ **`lwarpmk cleanall`**

2. Use *xelatex* or *lualatex* to compile the printed version a single time.

   Enter ⇒ **`xelatex tutorial.tex`**

   — *or* —

   Enter ⇒ **`lualatex tutorial.tex`**

   When the compile occurs, the configuration files for *lwarpmk* are modified to remember which TeX engine was used. XeLaTeX or LuaLaTeX will be used for future runs of *lwarpmk*.

3. To recompile the document:

   Enter ⇒ **`lwarpmk print`**

   -and-

   Enter ⇒ **`lwarpmk html`**

4. Also remember to update the indexes and recompile again:

   Enter ⇒ **`lwarpmk htmlindex`**

   Enter ⇒ **`lwarpmk html`**

   Enter ⇒ **`lwarpmk printindex`**

   Enter ⇒ **`lwarpmk print`**

## 5.10 Using DVI LaTeX

Traditional DVI LaTeX may also be used along with `.eps` image files. An SVG version of each image must also be provided. *lwarpmk* may be used to convert image formats.

To convert EPS files to PDF:

Enter ⇒ **`lwarpmk epstopdf *.eps`** **(or a list of files)**

To convert PDF files to SVG:

Enter ⇒ **`lwarpmk pdftosvg *.pdf`** **(or a list of files)**

⚠ bitmapped fonts See section 7.4 regarding font selection to avoid the use of bitmapped fonts.

## 5.11 Using a glossary

lwarp supports the gloss and glossaries packages, although this tutorial does not supply an example.

### 5.11.1 gloss package

See section 8.6.11.

### 5.11.2 glossaries package

To process the glossary for the print version:

Enter ⇒ **`lwarpmk printglossary`**

⚠ (If **`makeglossaries`** is not found, see section 8.6.12.)

To process the glossary for the HTML version:

Enter ⇒ **`lwarpmk htmlglossary`**

In each case, the document will have to be recompiled afterwards:

Enter ⇒ **`lwarpmk html1`**

Enter ⇒ **`lwarpmk html`**

Enter ⇒ **`lwarpmk print1`**

Enter ⇒ **`lwarpmk print`**

See section 8.6.12 to set options for processing glossaries.

## 5.12 Cleaning auxiliary files

To remove the auxiliary files `.aux`, `.toc`, `.lof`, `.lot`, `.idx`, `.ind`, `.log`, and `.gl*`, and a few others:

Enter ⇒ **`lwarpmk clean`**

## 5.13 Cleaning auxiliary and output files

To remove the auxiliary files, and also remove the `.pdf` and `.html` files:

Enter ⇒ **`lwarpmk cleanall`**

## 5.14 Cleaning the images from the <project>-images directory

The `<project>-images` directory contains SVG images automatically generated for inline and display math, tikz, etc. To remove all the images from the `<project>-images` directory:

Enter ⇒ **`lwarpmk cleanlimages`**

## 5.15 Converting PDF or EPS images to SVG

HTML cannot display PDF or EPS images, so any external PDF graphics images must be converted to SVG format. *pdftocairo* and *epstopdf* may be used one image at a time, but *lwarpmk* also provides a way to convert PDF or EPS images in bulk:

Enter ⇒ **`lwarpmk epstopdf *.eps`** **(or a list of files)**

Enter ⇒ **`lwarpmk pdftosvg *.pdf`** **(or a list of files)**

Be sure to always provide SVG files for HTML output.

## 5.16 Creating HTML from an incomplete compile

During testing it may be useful to finish the HTML conversion even when the document had errors and did not compile successfully. To attempt an HTML conversion of an incomplete document:

Enter ⇒ **`lwarpmk pdftohtml [-p project]`**

## 5.17 Processing multiple projects in the same directory

⚠ xr, xr-hyper, xcite

It is possible to have several projects in the same directory. *lwarpmk* has an optional parameter which is the document to compile.

To create each project:

Enter ⇒ **pdflatex project_a**

Enter ⇒ **pdflatex project_b**

Each project is given its own configuration file:

`project_a.lwarpmkconf, project_b.lwarpmkconf`

To compile each project with `lwarkmk`:

Enter ⇒ **lwarpmk print -p project_a**

Enter ⇒ **lwarpmk print -p project_b**

Enter ⇒ **lwarpmk html -p project_a**

Enter ⇒ **lwarpmk html -p project_b**

To generate each project's images:

Enter ⇒ **lwarpmk limages -p project_a**

Enter ⇒ **lwarpmk limages -p project_b**

To clean each project's images:

Enter ⇒ **lwarpmk cleanlimages -p project_a**

Enter ⇒ **lwarpmk cleanlimages -p project_b**

To clean each project's auxiliary files:

Enter ⇒ **lwarpmk cleanall -p project_a**

Enter ⇒ **lwarpmk cleanall -p project_b**

If using *bibtex*, for example, the HTML version must also be processed:

Enter ⇒ **bibtex project_a_html**

## 5.18 Using the *make* utility

*lwarpmk* has an action which may be useful for integration with the common *make* utility:

`lwarpmk pdftohtml [-p project]`

*make* may be used to compile the code to PDF with HTML tags (`project_html.pdf`), then *lwarpmk* may be used to convert each target to HTML files.

## 5.19 What next?

**How do I do something?** See the General Index.

**Something do not work!** See the Troubleshooting Index or section 13: Troubleshooting.

**Package options:** See section 29, Package options.

**HTML and filename settings:** See section 7.6, Customizing the HTML output.

**Footnote placement:** See section 7.6, Customizing the HTML output.

**Title page, indexing, glossaries:** See section 8.6, Front and back matter.

**Shell escape:** See section 7.3, Shell escape.

**CSS customization:** See section 7.7, Customizing the CSS.

**MathJax customization:** See section 8.7.5, Customizing MathJax.

**Localization:** (languages) — See section 7.1, Localization.

**Accessibility:** (`alt` and `title` tags) — See section 7.2, Accessibility.

**Converting an existing document:** See section 6, Converting an existing document.

**EPUB conversion:** See section 10, EPUB conversion.

**Word processor conversion:** See section 11, Word-processor conversion.

# 6 Converting an existing document

To convert an existing document for use with lwarp:

1. Arrange the document in the following order:
   (a) Declare the `\documentclass`.
   (b) Load text fonts.
   (c) Load inputenc or inputenx, fontenc, or fontspec.
   (d) Load lwarp.
   (e) Load remaining packages.
2. Modify the document:

⚠ math in section names

   (a) If using named HTML files, in section names use paren math `\(x+y\)` instead of dollar math `$x+y$`. (Dollar math works, but appears in the filename.) Or, use a short name for the TOC entry without the math, or use `\texorpdfstring` from the hyperref package:

```
\section{Some math \texorpdfstring{$1+2=3$}{three}}
```

⚠ `scale`

   (b) Avoid using the `\includegraphics` `scale` option. Change:

```
\includegraphics[scale=<xx>]{ . . . }
```

   to:

```
\includegraphics[width=<yy>\linewidth]{ . . . }
```

⚠ tabular

   (c) Possible changes to `tabular` environments include: `*` columns, multirow, longtable, supertabular, xtab, bigdelim. See section 8.10.1.

⚠ package options

   (d) If using braces in package options, such as with caption, see section 8.1.
   (e) Possible option clashes with memoir. See section 8.13.

⚠ indexes

   (f) If using indexes, see section 8.6.15.
   (g) If using many indexes, glossaries, `.aux` files, etc., see section 8.6.15 regarding morewrites. If morewrites is already used, be sure to add the setup with `allocate=10`.
   (h) Other changes as per Special cases and limitations, section 8.
3. Convert any PDF images to SVG. See section 8.8.
4. Manually compile the print version with *latex*, *pdflatex*, *lualatex*, or *xelatex*.
5. `lwarpmk print` to finish the print version.
6. `lwarpmk html` to create the HTML version.
7. `lwarpmk limages` to create the SVG images of any SVG math, `lateximage`, Ti*k*z, etc.

Need help?

See the General Index for "how-to", and the Troubleshooting Index if something doesn't work. A Troubleshooting section is also available. The Index of Objects contains automated entries for each package, macro, environment, counter, boolean, and other objects; individually and also sorted by category.

Table 5: Localization settings

**Object names:** LaTeX provides redefinable names for various objects, and lwarp adds a few more. Use `\renewcommand` to change these.

**`\abstractname`:** This macro is honored by lwarp.

**`\linkhomename`:** Displayed by the link to the homepage.

**`\linkpreviousname`:** Displayed by the link to the previous page

**`\linknextname`:** Displayed by the link to the next page.

**`\sidetocname`:** Displayed at the head of the sideTOC.

**HTML settings:** See table 8 and section 7.6 for details.

**`\HTMLLanguage`:** The language to declare for each web page.

**`\ImageAltText`, `\MathImageAltText`, `\PackageDiagramAltText`, `\AltTextOpen`, `\AltTextClose`:** The defaults used for HTML `alt` text for images. See section 7.2.

**`\CSSFilename`:** The name of the CSS file to use.

**`\MathJaxFilename`:** The name of the MathJax script to use.

**Package options:**

**`ImagesName` and `ImagesDirectory`:** These options control the filenames used by lwarp when it automatically generates images. See table 7 and section 7.5.

**`xindyStyle`, `xindyLanguage`, `xindyCodepage`:** When using *xindy*, these options may be set according to local use. See section 8.6.21.

**`pdftotextEnc`:** To adjust the encoding of *pdftotext*.

# 7 Additional details

## 7.1 Localization

Regional localization is supported by lwarp via the package options and macros shown in table 5.

## 7.2 Accessibility

lwarp provides several methods for improving access to the document using tools such as text-only browsers, copy/paste, text-to-speech readers, or Braille readers. HTML provides the `alt` text attribute for images, which is used by lwarp as describe below. HTML also provides the `title` attribute, which usually generates a pop-up text. lwarp can add this to a reference or hyperlink. MathJax also has provisions for improved accessibility as well. See table 6.

Table 6: Accessibiltiy settings

**\ImageAltText:** The default HTML `alt` text for `\includegraphics` and `lateximages`. Set with `\renewcommand`.

**\includegraphics alt key:** For `\includegraphics`, lwarp adds the `alt` key/value. For example:

```
\includegraphics[alt={Some text.}]{filename}
```

**SVG math:** For simple SVG math, lwarp places the LaTeX math expression in the `alt` text, so that the LaTeX expression may be copied and pasted to another document as plain text.

**\MathImageAltText:** For complicated SVG math, such as enclosed in `\InlineMathOther`/`\InlineMathNormal`, or `\DisplayMathOther`/`\DisplayMathNormal`, the HTML `alt` text will be set to `\MathImageAltText`. Set with `\renewcommand`.

**MathJax:** For MathJax, the accessibility tools provided by MathJax are enabled by default by lwarp's MathJax scripts.

**\PackageDiagramAltText:** Various packages create diagrams which lwarp converts into SVG images. These are given `alt` text set to `\PackageDiagramAltText`. Set with `\renewcommand`.

**\ThisAltText:** The HTML `alt` text of the next image may be set with:

```
\ThisAltText{Custom text about the image.}
<SVG math, Tikz, picture, etc.>
```

The next single image will be generated with the given text, and the following images will revert to back to their defaults.

`\ThisAltText` may also be used to assign an HTML `title` to the next reference or hyperlink.

```
\ThisAltText{Custom text about the link.}
Text ... \ref{label_name} ... text.
```

See section 7.6.

**\AltTextOpen and \AltTextClose:** By default, HTML `alt` text is enclosed by parentheses. This may be changed by redefining `\AltTextOpen` and `\AltTextClose`. Set with `\renewcommand`.

## 7.3 Shell escape

Opt --shell-escape

Some documents require the use of an external program, which is allowed when using the `--shell-escape` command-line option. When the document is first compiled manually, and also whenever the print version is recompiled, lwarp detects and remembers whether shell escape is enabled. If so, it will also be enabled when the document is recompiled with *lwarpmk*.

## 7.4 Font and UTF-8 support

⚠ type 3 bitmapped fonts

lwarp uses *pdftotext* to convert PDF output into UTF-8-encoded text. This process requires that UTF-8 information be embedded in the PDF file, which may prevent the use of older "type 3" bit-mapped fonts, and of older packages such as ae. The lwarp option `pdftotextEnc` may be useful in some situations. See section 7.5.

vector fonts
Computer Modern
⚠ *pdflatex*
⚠ DVI *latex*
Pkg cm-super

While using DVI *latex* or PDF *pdflatex*, if no font-related package is specified then the default Computer Modern font is used, which may be a "type 3" bit-mapped font which may not convert well to plain text. A "type 1" vector font is required.

To use the updated cm-super's type 1 fonts instead of Computer Modern, install the cm-super font package.

Pkg lmodern

To use Latin Modern instead, add

```
usepackage{lmodern}
```

to the preamble.

Pkg dejavu

Another useful option is the Deja Vu series of fonts, which have an increased coverage of language and glyphs:

```
\usepackage{dejavu}
```

*latex*, *pdflatex*, T1, UTF8

While using DVI *latex* or PDF *pdflatex*, lwarp automatically loads fontenc with T1 encoding. fontenc may be loaded with an additional encoding after lwarp. inputenc is automatically loaded with UTF8 encoding if if has not yet been loaded, but may also be specified with another encoding such as `latin1`. See the next section regarding index encoding.

⚠ *xelatex*, *lualatex*, fontspec

XeLaTeX and LuaLaTeX users must use the fontspec package. Do NOT use fontenc!

Place fontspec or fontenc, xunicode, and other font and UTF-8 related commands after the `\documentclass` command and before `\usepackage{lwarp}`.

⚠ package conflicts

In some cases, a package conflict may require that a font package be loaded after lwarp, which should work as well:

1. `documentclass{article/book/report}` comes first, followed by any of:
2. Font and UTF-8 related commands:
   - For XeLaTeX or LuaLaTeX:
     - fontspec and font choices

Pkg fontspec

ligatures

lwarp sets the following to turn off TeX ligatures during the generation

of HTML tags, and turn off common ligatures in regular text, since older browsers may not display them correctly and newer browsers can automatically re-create them.

```
\defaultfontfeatures[\rmfamily]{Ligatures={NoCommon,TeX}}
\defaultfontfeatures[\sffamily]{Ligatures={NoCommon,TeX}}
\defaultfontfeatures[\ttfamily]{Ligatures=NoCommon}
```

- For *pdflatex*:

Pkg lmodern
Pkg fontenc
Pkg inputenc
Pkg inputenx
Pkg newunicodechar
File glyphtounicode.tex

(a) `\usepackage{lmodern}`, or other font-related packages
(b) `\usepackage[T1]{fontenc}`
(c) `\usepackage[utf8]{inputenc}`, or `latin1`, etc. Or use inputenx.
(d) `\usepackage{newunicodechar}` along with related definitions.
(e) To assist with the PDF-HTML conversion:
   i. `\input glyphtounicode.tex`
   ii. `\input glyphtounicode-cmr.tex% from the pdfx package`
   iii. `\pdfgentounicode=1`

⚠ dotless j

Pkg cmap
Pkg mmap

(f) Another option to assist with the PDF-HTML conversion, such as the dotless j (`\j`):
   – `\usepackage{cmap}` — *or* —
   – `\usepackage{mmap}` — *or* —
   – `\usepackage[noTeX]{mmap}`

Pkg textcomp

(g) `\usepackage{textcomp}`

3. `\usepackage{newtxmath}` or other math-related font packages. Many of these load amsmath, which may now be loaded before lwarp.

4. `\usepackage{lwarp}` (section 7.5) is placed after any of the above, followed by:

⚠ fontspec with monospaced fonts

5. `\setmonofont{TeX Gyre Cursor}` or similar may be required if using XeLaTeX or LuaLaTeX and fontspec along with traditional font packages such as txfonts, newtxtext, etc. This is required to turn off the monospaced font's ligatures with fontspec after loading the traditional font packages. Monospaced output ligatures must be turned off to produce the correct HTML characters.

   Any monospace font with built-in ligatures may require these ligatures to be disabled for HTML. In one example, JetBrain Mono, it is required to use

⚠ JetBrain Mono
⚠ HTML corrupted

```
\setmonofont{JetBrains Mono}[%
. . .
Contextuals=AlternateOff,
]
```

   After lwarp is loaded, the ligature may be re-enabled for print mode by using `\setmonofont` again inside a `warpprint` environment.

6. … the rest of the preamble and the main document.

⚠ UTF-8 locale

In some cases, an external program may require a UTF-8 "locale". See section 9.8.

### 7.4.1 Indexes, glossaries, and encoding

lwarp supports *makeindex*, *xindy*, *xindex*, and glossaries, gloss, and nomencl.

See section 8.6.14 for indexing, and section 8.6.12 for the glossaries package.

## 7.5 lwarp package loading and options

lwarp supports book, report, and article classes, as well as the equivalent Koma-script classes and memoir, and various CJK-related classes and packages.

Load the lwarp package immediately after the font and UTF-8 setup commands.

Package options may be set while loading lwarp, or later with

```
\lwarpsetup{⟨key=value, . . . ⟩}
```

Pkg lwarp

lwarp package options are as follows:

Opt mathsvg
Opt mathjax
Default: mathsvg

**mathsvg** and **mathjax:** Selects SVG images or MathJax for math display. See section 8.7.

Opt latexmk
Default: false

**latexmk:** Tells *lwarpmk* to use *latexmk* to recompile the document several times if necessary. Otherwise, *lwarpmk* attempts to determing for itself whether to recompile. See section 7.6.

Opt dvips
Default: false

**dvips:** Tells *lwarpmk* to use *dvips* and *ps2pdf* to convert DVI output to PDF.

Opt dvipdfm
Default: false

**dvipdfm:** Tells *lwarpmk* to use *dvipdfm* to convert DVI output to PDF.

Opt dvipdfmx
Default: false

**dvipdfmx:** Tells *lwarpmk* to use *dvipdfmx* to convert DVI output to PDF.

Opt HomeHTMLFilename
Default: \BaseJobname

**HomeHTMLFilename:**

Filename of the homepage, without the "`.html`" suffix. Defaults to the `\BaseJobname`. A common setting is:

```
HomeHTMLFilename=index
```

filename underscores

causing the homepage to be the file `index.html`. Underscores are allowed in `HomeHTMLFilename` and `HTMLFilename` options, but may need to be escaped elsewhere, such as when appearing in a list:

```
\item [\href{file\_name.pdf}{text}] \
```

See section 7.6.1 for examples of naming and numbering HTML files.

Opt HTMLFilename
Default: <empty>

**HTMLFilename:** A filename prefix for the rest of the HTML web pages. Useful for numbered web pages with a common prefix. May be empty. See section 7.6.1 for examples of naming and numbering HTML files.

Opt ImagesName
Default: image-

**ImagesName:** The prefix for the images automatically generated by lwarp for objects such as SVG math and `lateximages`.

Opt ImagesDirectory
Default: \jobname-images

**ImagesDirectory:** The directory for the images automatically generated by lwarp for objects such as SVG math and `lateximages`. By default, these images will appear in a

Table 7: Lwarp package options

| Option | Description |
|---|---|
| mathsvg | Show math using SVG images. |
| mathjax | Show math using MathJax. |
| latexmk | Use *latexmk* for compiling documents. |
| dvips | Use *dvips* and *ps2pdf* to convert DVI documents. |
| dvipdfm | Use *dvipdfm* to convert DVI documents. |
| dvipdfmx | Use *dvipdfmx* to convert DVI documents. |
| HomeHTMLFilename | The filename of the home page. |
| HTMLFilename | A prefix for the filenames of the remaining web pages. |
| ImagesName | A prefix for the filenames of generated images. |
| ImagesDirectory | The directory used to hold generated images. |
| PrintLatexCmd | The shell commands for **lwarpmk print**. |
| HTMLLatexCmd | The shell commands for **lwarpmk html**. |
| For indexing (section 8.6.15) and glossaries (section 8.6.12): | |
| makeindex | Use *makeindex* to generate indices. |
| makeindexStyle | Set a custom style for *makeindex*. |
| xindy | Use *xindy* to generate indices. |
| xindyStyle | Set a custom style for *xindy*. |
| xindyLanguage | The *xindy* language option used for index generation. |
| xindyCodepage | The *xindy* codepage option used for index generation. |
| xindex | Use *xindex* to generate indices. |
| xindexConfig | Set a custom configuration file for *xindex*. |
| PrintIndexCmd | Shell commands executed by **lwarpmk printindex**. |
| HTMLIndexCmd | Shell commands executed by **lwarpmk htmlindex**. |
| LatexmkIndexCmd | Shell commands executed by *latexmk*. |
| IndexRef | How to format index links. |
| GlossaryCmd | Shell command executed by **lwarpmk printglossary** and **lwarpmk htmlglossary**. |
| Seldom necessary: | |
| OSWindows | Force compatibility with MS-Windows. |
| pdftotextEnc | Set the encoding for *pdftotext*. |
| lwarpmk | Generate a local copy of `lwarpmk.lua`. |
| Used internally by lwarp: | |
| warpprint | Generate print output, and also generate configuration files. |
| warpHTML | Generate HTML output. |
| BaseJobname | The `\jobname` to use. Set to the `\jobname` of the printed version even while generating HTML. |

directory named `<jobname>-images`, and the images will be named and numbered `image-<nn>`.

Opt `PrintLatexCmd` Default: `<automatic>`

**`PrintLatexCmd:`** Sets the shell commands executed by **`lwarpmk print`**. If not specified, will automatically be set according to the detected LaTeX engine and the use of `--shell-escape`.

Opt `HTMLLatexCmd` Default: `<automatic>`

**`HTMLLatexCmd:`** Sets the shell commands executed by **`lwarpmk html`**. If not specified, will automatically be set according to the detected LaTeX engine and the use of `--shell-escape`.

Opt `makeindex` Default: `makeindex`

**`makeindex:`** Sets `PrintIndexCmd`, `HTMLIndexCmd`, and `LatexmkImageCmd` to use *makeindex* when generating indexes with **`lwarpmk printindex`**, **`lwarpmk htmlindex`**, or *latexmk*. If neither `makeindex` nor `xindy` is used, `makeindex` is assumed.

Opt `makeindexStyle` Default: `lwarp.ist`

**`makeindexStyle:`** If you wish to use a custom `.ist` file for index generation, see section 8.6.20.

Opt `xindy` Default: `makeindex`

**`xindy:`** Sets `PrintIndexCmd`, `HTMLIndexCmd`, and `LatexmkImageCmd` to use *xindy* when generating indexes with **`lwarpmk printindex`**, **`lwarpmk htmlindex`**, or *latexmk*.

Opt `xindyStyle` Default: `lwarp.xdy`

**`xindyStyle:`** If you wish to use a custom `.xdy` file for index generation, see section 8.6.21.

Opt `xindyLanguage` Default: `english`

**`xindyLanguage:`** If using an index or glossary, see section 29.

Opt `xindyCodepage` Default: `utf8`

**`xindyCodepage:`** If using an index, see section 29.

Opt `xindex` Default: `makeindex`

**`xindex:`** Sets `PrintIndexCmd`, `HTMLIndexCmd`, and `LatexmkImageCmd` to use *xindex* when generating indexes with **`lwarpmk printindex`**, **`lwarpmk htmlindex`**, or *latexmk*.

Opt `xindexConfig` Default: `<empty>`

**`xindexConfig:`** If you wish to use a custom `xindex-*.lua` file for index generation, see section 8.6.22.

Opt `PrintIndexCmd` Default: `<automatic>`

**`PrintIndexCmd:`** Sets the shell commands executed by **`lwarpmk printindex`**. If not specified, will be set by the selection of `makeindex` or `xindy`. May be used to specify the creation of multiple indexes. See section 8.6.15.

Examples:

```
makeindex -s lwarp.ist projectname.idx                (makeindex)
xindy -M lwarp.xdy -L english -C utf8 projectname.idx      (xindy)
```

automatic setting

The use of the `makeindex` or `xindy` options sets `PrintIndexCmd` to sensible values for each of those programs while compiling a single index. lwarp's `makeindexStyle`, `xindyStyle`, `xindyLanuage`, and `xindyCodepage` options will be used if specified.

⚠ xindy

If specifying `PrintIndexCmd` manually, be sure to assign an *xindy* language and

codepage with the `-L` and `-C` *xindy* options, as the lwarp `xindyLanguage` and `xindyCodepage` options are not used for the `PrintIndexCmd` option when it is set manually.

This option is stored in the configuration files `lwarpmk.conf` and `*.lwarpmkconf`, and is then passed by the **`lwarpmk printindex`** command to the operating system to compile the print indexes. Since the command string is parsed by TEX, written to a file, read from the file by LuaTEX, and finally passed to the operating system, any attempt at quoting will be problematic. For complicated commands, it would be best to create a shell script, and simply refer to the script with the lwarp `PrintIndexCmd` option.

Opt `HTMLIndexCmd`
Default: `<automatic>`

**`HTMLIndexCmd:`** Sets the shell commands executed by **`lwarpmk htmlindex`**. If not specified, will be set by the selection of `makeindex` or `xindy`. May be used to specify the creation of multiple indexes. See section 8.6.15.

⚠ filenames

Example settings are similar to `PrintIndexCmd`, but append `_html` to the filenames:

```
makeindex -s lwarp.ist projectname_html.idx            (makeindex)
xindy -M lwarp.xdy -L english -C utf8 projectname_html.idx  (xindy)
```

automatic setting

The use of the `makeindex` or `xindy` options sets `HTMLIndexCmd` to sensible values for each of those programs while compiling a single index. lwarp's `makeindexStyle`, `xindyStyle`, `xindyLanuage`, and `xindyCodepage` options will be used if specified.

⚠ xindy

If specifying `HTMLIndexCmd` manually, be sure to assign an *xindy* language and codepage with the `-L` and `-C` *xindy* options, as the lwarp `xindyLanguage` and `xindyCodepage` options are not used for the `HTMLIndexCmd` option when it is set manually.

As with `PrintIndexCmd`, to generate complicated indexes it may be worthwhile to use a shell script, then refer to that script with `HTMLIndexCmd`.

Opt `LatexmkIndexCmd`
Default: `<automatic>`

**`LatexmkIndexCmd:`** Sets the shell commands executed by *latexmk*. Unlike `PrintIndexCmd` and `HTMLIndexCmd`, `LatexmkIndexCmd` does not include any filenames, which will be provided instead by *latexmk*. See section 8.6.15.

Example settings are similar to `PrintIndexCmd`, but without a filename:

```
makeindex -s lwarp.ist                                 (makeindex)
xindy -M lwarp.xdy -L english -C utf8                      (xindy)
```

automatic setting

The use of the `makeindex` or `xindy` options sets `LatexmkIndexCmd` to either of the two settings show above. lwarp's `makeindexStyle`, `xindyStyle`, `xindyLanuage`, and `xindyCodepage` options will be used if specified. Unlike `PrintIndexCmd` and `HTMLIndexCmd`, *latexmk* uses either of the single-line settings of `LatexmkIndexCmd` shown above to compile each of multiple indexes if necessary.

⚠ xindy

If specifying `LatexmkIndexCmd` manually, be sure to assign an *xindy* language and codepage with the `-L` and `-C` *xindy* options, as the lwarp `xindyLanguage` and `xindyCodepage` options are not used for the `LatexmkIndexCmd` option when it is set manually.

Opt `IndexRef`
Default: `cref`

**`IndexRef:`** Describes how to display the index entries for HTML output. Possible values are `ref`, `nameref`, `refnameref`, `cref`, `crefnameref`, `autoref`, or a text string such

as (link) or (*) for each index entry reference. (Adding parentheses around a single character makes the link larger and easier to click on.) The default is cref, which is available even if the print document does not use cleveref, as the lwarp package relies on cleveref during HTML output. Option autoref gives the same results as cref.

\ref and \cref to starred or otherwise unknown links will display as (*) instead of ??.

⚠ ?? If using cref (the default), and if a reference appears as ?? with a non-functional link, use cleveref's \crefname to give a name to that type of label.

In general, crefnameref gives the most information, but the index can become quite verbose. Using (*) or similar yields a very compact index.

Opt GlossaryCmd
Default: **makeglossaries**

**GlossaryCmd:** Sets the shell command executed by **lwarpmk printglossary** and **lwarpmk htmlglossary**. The print or HTML glossary filename is appended to this command. See section 8.6.12.

Opt OSWindows

**OSWindows:** lwarp attempts to automatically sense WINDOWS, but it may be forced with this option. See section 7.9.

Opt pdftotextEnc
Default: UTF-8

**pdftotextEnc:** Used to specify the encoding used by *pdftotext* during the PDF-HTML conversion. In most situations, the default is the correct choice.

Opt lwarpmk

**lwarpmk:** If you wish to have lwarp generate a local copy of lwarpmk.lua for archival or local-installation purposes, compile the print version with the lwarpmk option set. See section 29.

---

The following options are used internally by lwarp, and usually are not used in the user's document:

---

Opt warpprint
Opt warpHTML

**warpprint** and **warpHTML:** Usually controlled by *lwarpmk*, and not set in the document. Select the warpprint option to generate print output (default), or the warpHTML option to generate HTML5 output. The default is print output, so the print version may be compiled with the usual *pdflatex*, etc. When lwarp is loaded in print mode, it creates <project>_html.tex, which sets the warpHTML option before calling the user's source code <project>.tex. In this way, <project>.tex can \usepackage{lwarp} without any options to create a printed version, while <project>_html.tex will create an HTML version.

Opt BaseJobname
Default: \jobname

**BaseJobname:** Not intended for the user. Used internally by lwarp when creating the *_html.tex file used to compile the HTML version. See section 29.

## 7.6 Customizing the HTML output

Table 8 shows several settings may be used to customize the HTML output. Watch for the correct placement of each!

⚠ Placement!

⚠ Changes! Note that if changes are made, it is best to first:

1. Clear all the HTML, PDF, and auxiliary files:
   Enter ⇒ **`lwarpmk clearall`**
2. Recompile the print version in order to recreate the configuration files for *lwarpmk*:
   Enter ⇒ **`lwarpmk print`**
3. Finally, recompile the HTML version with the new settings:
   Enter ⇒ **`lwarpmk html`**

**Placed in the preamble before `\begin{document}`:**

`\HTMLFirstPageTop` Default: `<empty>`

**`\HTMLFirstPageTop`:** {⟨*contents*⟩} A user-definable custom action applied to the top of the home page. Useful for logos, etc. `\LinkNext` may be used to link to the next web page. Defaults empty. Ignored in print output.

`\HTMLFirstPageBottom` Default: `<empty>`

**`\HTMLFirstPageBottom`:** {⟨*contents*⟩} A user-definable custom action applied to the bottom of the home page. Useful for logos, etc. `\LinkNext` may be used to link to the next web page. Defaults empty. Ignored in print output.

`\linkhomename` Default: `Home`

**`\linkhomename`:** Name of the link to the home page. Paragraphs are allowed. Redefine with `\renewcommand`.

`\linkpreviousname` Default: `Previous`

**`\linkpreviousname`:** Name of the link to the previous page. Paragraphs are allowed. Redefine with `\renewcommand`.

`\linknextname` Default: `Next`

**`\linknextname`:** Name of the link to the next page. Paragraphs are allowed. Redefine with `\renewcommand`.

Ctr `tocdepth`

**`tocdepth`:** Sectioning depth of the table of contents. See section 16 for a list of LaTeX stack depths.

Ctr `SideTOCDepth` Default: 1

**`SideTOCDepth`:** Sectioning depth of the sideTOC. Defaults to 1, causing the sideTOC to show sections but not subsections.

sideTOC

Each subpage of the website has its own small table of contents on the side (the "sideTOC"). Its depth is set by `SideTOCDepth`. This sideTOC is only shown if the browser display is wide enough. When using a narrow web browser window, "responsive web design" is used to show the sideTOC at the top of the page, as well as a link back to Home at the top and bottom.

It is recommended to set:

```
SideTOCDepth=FileDepth
```

or

```
SideTOCDepth=FileDepth+1
```

Table 8: HTML settings

| Macro/Cntr/Bool | Loc* | Description |
|---|---|---|
| \linkhomename | P | Name of the link to the homepage. |
| \linkpreviousname | P | Name of the link to the previous page. |
| \linknextname | P | Name of the link to the next page. |
| SideTOCDepth | P | Sectioning depth of the sideTOC. |
| \sidetocname | P | Name of the sideTOC. |
| FileDepth | P | Sectioning depth of the file splits. |
| CombineHigherDepths | P | Combine higher section levels. |
| FileSectionNames | P | Use section names for file names, else use numbers. |
| \FilenameLimit | P | Maximum length of the generated filenames. |
| FootnoteDepth | P | Sectioning depth of footnotes. |
| \abstractname | P | The name of the abstract. |
| \ImageAltText | PD | \includegraphics and other images' alt tag. |
| \ThisAltText {⟨text⟩} | PD | Assigns an alt/title tag for the next image or link. |
| \MathImageAltText | PD | The SVG math image lateximage alt tag. |
| \PackageDiagramAltText | PD | The suffix for a package's lateximage alt tags. |
| \AltTextOpen | PD | Start an HTML alt tag. |
| \AltTextClose | PD | End an HTML alt tag. |
| \CSSFilename | PS | The CSS for the following files. |
| \MathJaxFilename | PS | The MathJax script for the following files. |
| \HTMLLanguage | PS | The HTML lang tag. |
| \HTMLTitle | PS | The homepage's <title>, overriding \title. |
| \HTMLTitleBeforeSection | PS | Set subpage <title>s to \HTMLTitle - sectionname |
| \HTMLTitleAfterSection | PS | Set subpage <title>s to sectionname - \HTMLTitle |
| \HTMLAuthor | PS | The HTML author meta tag, overriding \author. |
| \HTMLDescription | PS | The HTML description meta tag. |
| \HTMLFirstPageTop | P | Heading for the home page. |
| \HTMLFirstPageBottom | P | Footer for the home page. |
| \HTMLPageTop | PS | Heading for the other pages. |
| \HTMLPageBottom | PS | Footer for the other pages. |
| \IndexPageSeparator | P | Index page list separator. |
| \IndexRangeSeparator | P | Index page range separator. |
| FixSmallCaps | P | Set true if small caps rendered as all caps. |
| HTMLDebugComments | P | Boolean to generate HTML comments. |

* **P:** Preamble, **D:** Anywhere in the document. **S:** Before a section.

⚠ inaccessible pages

If SideTOCDepth < FileDepth, web pages will be inaccessible via the sideTOC.

\sidetocname
Default: Contents

**\sidetocname:** Name of the sideTOC. Paragraphs are allowed. Redefine with \renewcommand.

Ctr FileDepth
Default: -5

**FileDepth:** Sectioning depth of file splits. Defaults to -5, causing the entire HTML website to be one single file.

- To place the entire file into one HTML page, use:
  \setcounter{FileDepth}{-5}
- To split the HTML file at \section depth, use:
  \setcounter{FileDepth}{1}
- To ensure that the HTML pages/files are accessible:
  Place a \tableofcontents somewhere before the first section break (therefore in the "home page"), and set
  tocdepth >= FileDepth

⚠

Bool CombineHigherDepths
Default: true

**CombineHigherDepths:** Combine a higher section with its first lower subsections, down to the FileDepth. Defaults to true. Set to false to simulate the concept of a chapter opening on its own page, for example.

The file splits are controlled by the counter FileDepth and the boolean CombineHigherDepths. Setting FileDepth to 0 splits the file at chapters, 1 at sections, etc. CombineHigherDepths controls whether to combine pages at levels higher than the chosen FileDepth, such as in this tutorial where the page which opens the chapter also contains the first section. Be careful to set tocdepth and SideTOCDepth to allow access to each page of the website. Set tocdepth and SideTOCDepth to be greater than or equal to FileDepth.

⚠ Inaccesible pages!

⚠ Lost in an old page!

When making changes to the file structure, it is possible to end up with the web browser pointing to an old file which is no longer in use. When this occurs, changes to the web site will not appear in the browser, even if reloading the page, because that page is no longer in use. It is best to return to the home page, clean the files (lwarpmk cleanall), change FileDepth and/or CombineHigherDepths, then finally recompile and renavigate to the desired page using the new file structure.

Bool FileSectionNames
Default: true

**FileSectionNames:** If true, web page filenames are derived from a sanitized version of the section names. If false, web pages are numbered. Either way, the HTMLFilename option is used as a prefix. See section 7.6.1 for examples of naming and numbering HTML files. The user must ensure that filenames are unique after begin sanitized. For example, math in the section name is removed before creating the filename, so the rest of the filename must be sufficiently unique to avoid name collisions.

⚠ Unique filename!

\FilenameLimit
Default: 80

**\FilenameLimit:** The maximum length of the filenames generated by lwarp. ".html" is added to this length. Redefine with \renewcommand.

Ctr FootnoteDepth
Default: 3

**FootnoteDepth:** Determines where to place pending footnotes. 3 places footnotes before each break down to the \subsubsection level. 1 places footnotes before each \section break. Any pending footnotes are also placed at the bottom of each page before each file break.

Bool FixSmallCaps
Default: false

**FixSmallCaps:** Set true if Small Caps are rendering in all caps ("SMALL CAPS").

May be required for some fonts (erewhon, utopia, fbb, et al.), and packages such as embrac.

Bool HTMLDebugComments
Default: false

**HTMLDebugComments:** Set true to generate HTML comments, such as which section or  is being opened or closed.

\abstractname
Default: Abstract

**\abstractname:** The name of the abstract. This may also be over-written by the babel package. Defaults to "Abstract". Redefine with \renewcommand.

\IndexPageSeparator
Default: ", "

**\IndexPageSeparator:** Index page list separator. Adjust to match index style file. If using gindex, this is set automatically to gindex's \indexpagessep.

\IndexRangeSeparator
Default: "--"

**\IndexRangeSeparator:** Index page range separator. Adjust to match index style file. If using gindex, this is set automatically to gindex's \indexrangesep.

**Placed before \begin{document}, or before any sectioning command which causes a file break:**

\CSSFilename
Default: lwarp.css

**\CSSFilename:** {⟨*filename.css*⟩} Sets the CSS file to use for the following files. May be changed before each each sectioning command which would cause a file split.

The CSS styles of the web pages are set by the \CSSFilename command. If \CSSFilename is not used, a default plain style is used to mimic printed LaTeX output. lwarp_sagebrush.css is a semi-fancy colored style as shown in this tutorial. Change it to lwarp_formal.css for a more formal look, or comment out the \CSSFilename command to see the default. \CSSFilename may be used before each file break to set the CSS for individual pagess of the website.

\MathJaxFilename
Default: lwarp_mathjax.txt

**\MathJaxFilename:** {⟨*filename*⟩} Sets the MathJax script file to use for the following files. May be changed before each each sectioning command which would cause a file split.

The MathJax script file is copied into the head of each HTML file. This may be used to point to a local repository, add extensions, or change the script somewhere in the middle of the document. \MathJaxFilename may be used before each file break to set the script file for individual pages of the website.

\HTMLLanguage
Default: en-US

**\HTMLLanguage:** {⟨*langauge*⟩} The HTML file's HTML lang meta tag. Defaults to en-US.

\HTMLTitle
Default: \thetitle

**\HTMLTitle:** {⟨*title*⟩} Overrides \title for the HTML header's meta title. Defaults to \thetitle, which is set by \title, or empty otherwise. Unlike the author, \thetitle is set by \title even if not using the titling package.

\HTMLTitleBeforeSection
Default: \HTMLTitleBeforeSection

**\HTMLTitleBeforeSection:** Sets subpage <title> tags to show the website title followed by the section name.

\HTMLTitleAfterSection

**\HTMLTitleAfterSection:** Sets subpage <title> tags to show the section name followed by the website title.

custom <title>

To customize subpage <title>s, redefine \theHTMLTitleSection, which defaults to:

```
\def\theHTMLTitleSection{%
  \theHTMLTitle\theHTMLTitleSeparator\theHTMLSection%
}
```

\HTMLAuthor
Default: \theauthor

**\HTMLAuthor:** {⟨*author*⟩} The HTML header's meta author. Defaults to \theauthor, which is set by \author if using the titling package, but is empty otherwise. There are several ways to represent the author and affiliations, especially if using the authblk package, most of which do not result in a sensible \theauthor, so \HTMLAuthor is useful to create a list of authors without their affiliations.

\HTMLDescription
Default: <empty>

**\HTMLDescription:** {⟨*description*⟩} Sets the HTML description tag for the following files. May be changed before each each sectioning command which would cause a file split.

\HTMLPageTop
Default: <empty>

**\HTMLPageTop:** {⟨*contents*⟩} A user-definable custom action applied to the top of pages other than the home page. Useful for logos, etc. Defaults empty. \LinkHome may be used to place a link back to the homepage, as well as \LinkPrevious and \LinkNext. Ignored in print output.

\HTMLPageBottom
Default: <empty>

**\HTMLPageBottom:** {⟨*contents*⟩} A user-definable custom action applied to the bottom of pages other than the home page. Useful for authors, copyright notices, contact information, etc. Defaults empty. \LinkHome may be used to place a link back to the homepage, as well as \LinkPrevious and \LinkNext. Ignored in print output.

\LinkHome

**\LinkHome:** Creates a link to the home page. Usually used in \HTMLPageTop and related.

\LinkPrevious

**\LinkPrevious:** Creates a link to the previous HTML page, unless already at the home page. Usually used in \HTMLPageTop and related.

\LinkNext

**\LinkNext:** Creates a link to the next HTML page, unless already at the end. Usually used in \HTMLPageTop and related.

**Placed in the home page before the first sectioning command which causes a file break:**

\tableofcontents
⚠ TOC on the homepage!

**\tableofcontents:** Used to place a table of contents on the home page. This command must be used before the first file split, so that a way is available to navigate to other files from the homepage.

Links to each chapter/section are provided, as selected by tocdepth.

**Placed in the document wherever necessary:**

\ImageAltText
Default: image

**\ImageAltText:** Redefine with \renewcommand. \includegraphics and other images are assigned an HTML alt tag according to \ImageAltText along with \AltTextOpen and \AltTextClose. This text is visible in the browser if images are not loaded, and appears when the text is copied and pasted. The default is "image", and it may be changed according to the document's language. This may be set in the preamble, or changed as necessary inside the document, where it will affect the following \includegraphics and other images.

\ThisAltText

**\ThisAltText:** {⟨*text*⟩} \ThisAltText can be used to assign an HTML alt text attribute to the next image generated by a lateximage, picture, tikzpicture, or any other similar environment which generates an image, or the next SVG math expression. This tag is cleared after use. The tag is also cleared after

each MathJax expression, in case the user changes between SVG math and MathJax.

`\ThisAltText` also may be used to add an HTML `title` to a reference or hyperlink, such as a `\ref`, `\cref`, `\href`, `\url`, `\hyperref`, or `\hyperlink`. In each case, the alternative text is cleared after use.

`\MathImageAltText` Default: `math image`

**`\MathImageAltText`:** Redefine with `\renewcommand`. When creating an SVG math image, its HTML `alt` tag may be set to the math expression, which may be hashed for image reuse. In the case of `\ensuremath` or after `\inlinemathother`, where the contents require a unique image for each instance of the same expression, the `alt` tag is set to `\MathImageAltText`, along with `\AltTextOpen` and `\AltTextClose`, and the image is not reused.

This `alt` expression is visible in the browser if images are not loaded, and appears when the text is copied and pasted. The default is "`math image`", and it may be changed according to the document's language. This may be set in the preamble, or changed as necessary inside the document, where it will affect the following SVG math images.

`\PackageDiagramAltText` Default: `diagram`

**`\PackageDiagramAltText`:** Redefine with `\renewcommand`. For many packages, the output is placed inside a `lateximage` with an HTML `alt` tag set to the package name followed by `\PackageDiagramAltText`. For example:

```
(-xy- diagram)
```

This expression is visible in the browser if images are not loaded, and appears when the text is copied and pasted. The default is "diagram", and may it be changed according to the document's language. This may be set in the preamble, or changed as necessary inside the document, where it will affect the following package diagrams.

`\AltTextOpen` Default: `(`

**`\AltTextOpen`:** Redefine with `\renewcommand`.

`\AltTextClose` Default: `)`

**`\AltTextClose`:** Redefine with `\renewcommand`. HTML `alt` text is enclosed by the macros `\AltTextOpen` and `\AltTextClose`, which default to an opening and closing parenthesis.

Env `warpprint`

**`warpprint`:** An environment which is only used while generating print output. Place inside anything which does not apply to HTML and which may cause problems with lwarp. If lwarp knows about and emulates or supports a package then its related macros, lengths, counters, etc. probably won't have to be placed inside a `warpprint` environment, but unknown packages may cause problems which may be isolated from lwarp using this environment.

⚠ *Do not place anything else on the same line as* `\end{warpprint}`. Also do not nest `warpprint` inside itself.

Env `warpHTML`

**`warpHTML`:** An environment which is only included while generating HTML output. This is useful for website logos and other items which have no purpose in printed output.

⚠ *Do not place anything else on the same line as* `\end{warpHTML}`. Also do not nest `warpHTML` inside itself.

`\warpprintonly`

**`\warpprintonly`:** {⟨*contents*⟩} A macro version of the `warpprint` environment.

\warpHTMLonly **\warpHTMLonly:** {⟨*contents*⟩} A macro version of the warpHTML environment.

### 7.6.1 Example HTML file naming

Examples of ways to name or number HTML files:

**Numbered HTML nodes:**

Example: Homepage index.html, and node-1, node-2. [13]

```
\usepackage[
    HomeHTMLFilename=index,
    HTMLFilename={node-}
]{lwarp}
\boolfalse{FileSectionNames}
```

**Named HTML sections, no prefix:**

Example: index.html, and About.html, Products.html

```
\usepackage[
    HomeHTMLFilename=index,
    HTMLFilename={}
]{lwarp}
\booltrue{FileSectionNames}
```

**Named HTML sections, with prefix:**

Example: Homepage mywebsite.html, and additional pages such as mywebsite-About.html, mywebsite-Products, etc.

```
\usepackage[
    HomeHTMLFilename=mywebsite,
    HTMLFilename={mywebsite-}
]{lwarp}
\booltrue{FileSectionNames}
```

## 7.7 Customizing the CSS

\CSSFilename {⟨*filename*⟩}
Default: lwarp.css

\CSSFilename may be used to choose which .css file is used to display each page of the web site. Use \CSSFilename before \begin{document} to assign the style of the home page. If different parts of the website should have different styles, call \CSSFilename again before each section heading which creates a new file. This may be changed numerous times throughout the file, resulting in different HTML pages having different CSS files assigned:

[13] See \SetHTMLFileNumber to number in groups by chapter, for example.

```
...
\CSSFilename{myCSS.css}
\chapter{Another Chapter}
...
```

The styles provided by lwarp include:

**lwarp.css:** A default style if \CSSFilename is not used. This style is comparable to a plain LaTeX document. To set this style, you may use \CSSFilename{lwarp.css}, or no \CSSFilename call at all.

**lwarp_formal.css:** A formal style with a serif fonts and a traditional look.

**lwarp_sagebrush.css:** A style with muted colors, gradient backgrounds, additional borders, and rounded corners.

To see each style in use, change the \CSSFilename entry in the tutorial, lwarpmk html again, and then reload the tutorial webpage.

Custom css

A customized style may also be created. For each new project a file called sample_project.css is generated. This may be renamed to <project>.css then used by assigning \CSSFilename{<project>.css}.

⚠ Rename it!

Note that sample_project.css is overwritten whenever lwarp is loaded in print mode. It is therefore important to rename the file to something like <project>.css before using it, so that your own changes are not overwritten.

<project>.css has an entry which loads lwarp.css, and this entry may be changed to load lwarp_formal.css or lwarp_sagebrush.css if desired. Additional changes to the css may be made by making entries later in the <project>.css file.

File lwarp.css
File project.css
File sample_project.css

It is best to make a local project-specific css file such as project.css, containing only things which are different from lwarp.css. The file project.css should refer to lwarp.css as follows:

```
/* ( --- Start of project.css --- ) */
/* ( --- A sample project-specific CSS file for lwarp --- ) */

/* Uncomment one of the following: */
@import url("lwarp.css") ;
/* @import url("lwarp_formal.css") ; */
/* @import url("lwarp_sagebrush.css") ; */

/* Project-specific CSS setting follow here. */
/* . . . */

/* ( --- End of project.css --- ) */
```

Finally use \CSSFilename{<project>.css} in the document to activate the custom css.

## 7.8 Assigning css classes and styles

HTML CSS classes and styles may be assigned to fragments of the document.

Env BlockClass [⟨*style*⟩] {⟨*class*⟩}

An entire block of text, including paragraphs, may be assigned a CSS class and optional CSS style using the BlockClass environment. The result is placed inside a . A BlockClass may nest other BlockClasses or \InlineClasses.

\InlineClass (⟨*WP CSS style*⟩) [⟨*web CSS style*⟩] {⟨*CSS class*⟩} {⟨*text*⟩}

A section of text without paragraphs may be assinged a CSS class and optional CSS style using the \InlineClass macro. The result is placed inside a . \InlineClass may be nested, but per the HTML standard it must not contain BlockClass, nor may it contain a paragraph, nor several other objects such as HTML figures. \InlineClass also accepts a second optional parameter, enclosed inside parentheses, which assigns the style while generating output for a word processor, while ignoring the web style.

Nullified versions of BlockClass and \InlineClass are provided for the print version, so they may be used in the document without placing them inside warpHTML or \warpHTMLonly.

## 7.9 Selecting the operating system

Prog Unix
Prog Mac OS
Prog Linux
Prog MS-Windows
Prog Windows
Opt OSWindows

lwarp tries to detect which operating system is being used. UNIX / MAC OS / LINUX is the default (collectively referred to as "UNIX" in the configuration files), and MS-WINDOWS is supported as well.

If MS-WINDOWS is not correctly detected, use the lwarp option OSWindows.

When detected or specified, the operating-system path separator used by lwarp is modified, and the boolean usingOSWindows is set true. This boolean may be tested by the user for later use.

## 7.10 Selecting actions for print, HTML, or MATHJAX output

The following environments and macros are used to select actions which only apply to either traditional LaTeX print-formatted PDF generation, or to HTML generation, or to HTML with MATHJAX.

For most of built-in LaTeX and many additional packages there is user-level source code support or emulation, so no special handling will be required. For those cases which lwarp does not handle by itself, the following environments and macros may be used to isolate sections of code for print-only or HTML-only.

These environments are also useful for creating a special version of the titlepage for print and another for HTML.

Env warpHTML Anything which is to be done only for HTML5 output is surrounded by a warpHTML environment:

```
\begin{warpHTML}
 ... something to be done only during \HTML\ generation
\end{warpHTML}
```

⚠ `\end{warpHTML}` ⚠ nesting

Do *not* place anything else on the same line as `\end{warpHTML}`. The exact phrase is used to mark the end of the environment. Do not nest `warpHTML` inside itself. `warpMathJax` may be used inside `warpHTML`.

Env `warpprint`

Anything which is to be done only for print output is surrounded by a `warpprint` environment:

```
\begin{warpprint}
 ... something to be done only during traditional \PDF\ generation
\end{warpprint}
```

⚠ `\end{warpprint}` ⚠ nesting

As above, do not place anything else on the line with `\end{warpprint}`. Do not nest `warpprint` inside itself.

Env `warpall`

Anything which is to be done for any output may be surrounded by a `warpall` environment. Doing so is optional.

```
\begin{warpall}
 ... something to be done during print \PDF\ or \HTML\ output
\end{warpall}
```

⚠ `\end{warpall}` ⚠ nesting

As above, do not place anything else on the line with `\end{warpall}`. Do not nest `warpall` inside itself.

Macros are also provided for print-only or HTML-only code:

`\warpprintonly` {⟨*actions*⟩}

Performs the given actions only when print output is being generated.

`\warpHTMLonly` {⟨*actions*⟩}

Performs the given actions only when HTML output is being generated.

Env `warpMathJax`

⚠ `\end{warpMathJax}` ⚠ nesting

Anything which is to be done only while using HTML output with MathJax is surrounded by a `warpMathJax` environment. Usually, this is `\CustomizeMathJax`, used to add emulation macros. `\end{warpMathJax}` must appear on its own line. Do not nest `warpMathJax` inside itself. `warpMathJax` may be used inside `warpHTML`.

## 7.11 Commands to be placed into the `warpprint` environment

Certain print-related commands should always be placed inside a `warpprint` environment, or may need other special handling. These are unrelated to HTML output, but are hard to isolate automatically. For example:

- Paragraph formatting: `\parindent` `\parskip`
- Manual page positions such as the textpos package, which is emulated but only in a limited way.
- Anything changing the page counter. lwarp requires that the page counter not be adjusted during HTML output.

Some packages require additional setup commands. Where these packages are emulated for HTML, setup commands may work for the emulated HTML output as well as for print output. See the details for each package in this document for more information.

Also see section 13: Troubleshooting.

## 7.12 Title page

In the preamble, place an additional block of code to set the following:

```
\title{Document Title} % One line only
\author{Author One\affiliation{Affiliation One} \and
    Author Two\affiliation{Affiliation Two} }
\date{Optional date}
```

The title is used in the meta tags in the HTML files, unless overridden by `\HTMLTitle`, and the rest are used in `\maketitle`. To use a `\subtitle` or `\published` field, see section 68.8.

`\maketitle` Use `\maketitle` just after the `\begin{document}`, as this will establish the title of the homepage. Optionally, use a `titlepage` environment instead.

Env `titlepage` The `titlepage` environment may be used to hold a custom title page. The titlepage will be set in a `<div>` class `titlepage`, and `\printtitle`, etc. may be used inside this environment.

Env `titlingpage` Another form of custom title page, where `\maketitle` is allowed, and additional information may be included as well.

`\title` {⟨*title*⟩}

⚠ HTML corrupted ⚠ newlines Avoid newlines in the `\title`; these will interfere with the file break and CSS detection. Use a `\subtitle` command instead (section 68.8). The title will appear in the document `\maketitle` as a heading `<h1>`. The HTML meta `title` tag will also have this title, unless `\HTMLTitle` is used to set the meta title to something else instead.

`\author` {⟨*author*⟩}

In `\author`, `\protect` may be needed before some formatting commands. In HTML, the author will appear in a `<div>` of class `author` in the `\maketitle`. If the titling package is used, the author will also appear in a HTML meta tag, but `\HTMLAuthor` may be necessary to create a plain list of names if `\author` had affiliations added. `\affiliation` is a new addition to lwarp.

`\date` {⟨*date*⟩}

\date works as expected. In HTML, this will appear in a  class titledate.

\thanks {⟨*text*⟩}

\thanks are allowed in the titlepage fields, and will be rendered as HTML notes at the bottom of the title page.

## 7.13 HTML page meta descriptions

\HTMLDescription {⟨*A description of the web page.*⟩}
Default: (none)

limitations Each page of HTML output should have its own HTML meta description, which usually shows up in web search results, is limited to around 150 characters in length, and should not include the ASCII double quote character (").

placement Use \HTMLDescription just before \begin{document} to set the description of the home page, and also just before each sectioning command such as \chapter or \section where a new file will be generated, depending on FileDepth. For example, if FileDepth is 1, use \HTMLDescription just before each \section command, and that description will be placed inside the HTML page for that \section. The same descrition will be used for all following HTML files as well, until reset by a new \HTMLDescription. It is best to use a unique description for each HTML file.

disabling To disable the generation of HTML description meta tags, use:

```
\HTMLDescription{}
```

## 7.14 HTML homepage meta title

\HTMLTitle {⟨*title*⟩}
Default: \HTMLtitle{\thetitle}

Sets the contents of the web page <meta name="title"> element. May be set empty to cancel the meta title tag.

See section 7.6 for \HTMLTitleBeforeSection and \HTMLTitleAfterSection, used to set the title for HTML subpages.

## 7.15 HTML page meta author

\HTMLAuthor {⟨*author*⟩}
Default: \HTMLAuthor{\theauthor}

Sets the contents of the web page <meta name="author"> element. May be set empty to cancel the meta author tag.

\author may be used to create a list of authors and their affiliations, in several formats if using authblk, and these may not successfully parse properly into a sensible list for \theauthor. \HTMLAuthor may be used to set the meta tag to a simple list of names.

# 8 Special cases and limitations

Some commonly-used LaTeX expressions should be modified as follows to allow for a smooth conversion to both HTML and print-formatted outputs.

Need help?

See the General Index for "how-to", and the Troubleshooting Index if something doesn't work. A Troubleshooting section is also available. The Index of Objects contains automated entries for each package, macro, environment, counter, boolean, and other objects; individually and also sorted by category.

## 8.1 Things to avoid

In the document, avoid the following:

⚠ options with braces

**Package options:** Package options may cause problems with lwarp, especially if they include curley braces.

If selecting options with braces in `\usepackage` does not work:

```
\usepackage[font={it,small}]{caption}% does not work
```

... try instead selecting the package options before loading lwarp:

```
\PassOptionsToPackage{font={it,small}}{caption}
...
\usepackage{lwarp}
...
\usepackage{caption}
```

... or try setting package options after the package has been loaded:

```
\usepackage{caption}
\captionsetup{font={it,small}}
```

**page counter:** Do not adjust the page counter. If doing so is required for the print version, place the adjustment inside a `warpprint` environment.

**Custom math environment macros:** Do not use expressions such as `\beq` as a replacement for `\begin{equation}`.

**Custom macros in section, figure, table names:** Custom macros which appear in sectioning commands or float captions then appear in the `.toc`, `.lof`, and `.lot` lists, and should be made robust using `\newrobustcmd` or `\robustify` from etoolbox, xparse, etc.

When setting `FileSectionNames` to `true` to name the HTML files from the section names, the file names are created from sanitized versions of the chapter or section names, but the section names must be plain text or something which expands into plain text. Robust macros will not work at the sectioning level which is used for file names, but a robust macro or other complicated name may be used for the manditory argument of `\chapter`, `\section`, etc., if a plain-text version is also included in the optional argument:

```
\chapter[Plain Name]{\ARobustMacro{Fancy Name}}
```

### 8.1.1 Invalid HTML

Additionally, some objects are valid LaTeX, but invalid HTML. An example is a tabular inside `\textbf`, since HTML does not allow a table inside a span. lwarp will create the table, and the browser may support it, but the result is technically invalid.

## 8.2 Formatting

### 8.2.1 Text formatting

⚠ `\bfseries`, etc. `\textbf`, etc. are supported, but `\bfseries`, etc. work only in some situations.

⚠ HTML special chars &, <, and > have special meanings in HTML. If `\&`, `\textless`, and `\textgreater` are used, proper HTML entities will be used, but there may be HTML parsing problems if these special characters occur unescaped in program listings or other verbatim text.

program listings For program listings, the listings package is supported, and its `literate` option is used to convert &, <, and > to proper HTML entities.

verbatim The various `verbatim`-related environments do not convert &, <, and >, so care must be taken to avoid accidentally including valid HTML code inside these environments. Adding a space on either side may be sufficient.

### 8.2.2 Small caps

`Bool FixSmallCaps` Some fonts, such as erewhon, utopia, or fbb, and some packages such as embrac, copy/paste "Small Caps" as all caps ("SMALL CAPS"), which lwarp then reads as all caps, so the text is printed in all caps. If small caps are being rendered as all caps, set:

```
\booltrue{FixSmallCaps}
```

⚠ CJK fonts Some CJK fonts may not work if `FixSmallCaps` is set `true`.

### 8.2.3 Horizontal and vertical space and rules

`\hspace` `\hspace` is converted to an inline HTML span of the given width, except that `0` width is ignored, a width of `.16667em` is converted to an HTML thin breakable space (`U+2009`), and a `\fill` is converted to a `\qquad`.

`\vspace` `\vspace` is ignored for HTML.

`~` `\,` ~ and `\,` are converted to HTML entities.

`\kern` `\hskip` `\kern` and `\hskip` are entered into the HTML PDF output as-is, then interpreted by *pdftotext*, and thus usually appear as a single space.

`\rule` `\rule` is converted to an HTML rule of the same dimensions, of the currently selected text color.

\hrule
\vrule

Both \hrule and \vrule are ignored for HTML. To create a horizontal dividing rule across the page, use \hrulefill in its own paragraph.

\hrulefill

\hrulefill usually creates a one-inch rule, similar to a "fill in the blank". If it is used at the start of a new paragraph, it creates a  with a thin horizontal border across the page, as would often be done with \hrule.

### 8.2.4 Text alignment

Use the environments center, flushright, flushleft instead of the macros \centering, \raggedright, \raggedleft.

⚠ figure & table alignment

\centering, etc. are honored in a figure or table if they are the first command inside the float:

```
\begin{table*}
\centering
\caption{A Table}
. . .
```

### 8.2.5 Accents

Native LaTeX accents such as \" will work, but many more kinds of accents are available when using Unicode-aware XeLaTeX and LuaLaTeX. If using accents in section names which will become file names, it is recommended to use the LaTeX accents such as \" and \v instead of Unicode accents. The LaTeX accents will have the accents stripped when creating the filenames, whereas the Unicode accents will appear in the file names, which may cause issues with some operating systems.

### 8.2.6 textcomp package

Pkg textcomp

Some textcomp symbols do not have Unicode equivalents, and thus are not supported.

⚠ missing symbols

Many textcomp symbols are not supported by many system/browser fonts. In the CSS try referencing fonts which are more complete, but expect to see gaps in coverage.

### 8.2.7 Superscripts and other non-math uses of math mode

Use \textsuperscript{x} instead of $^{x}$

### 8.2.8 Empty \item followed by a new line of text or a nested list:

lists

Use a trailing backslash: \item[label] \

### 8.2.9 Filenames and URLs in lists or footnotes

filename underscore

Escape underscores in the filenames:

```
\item[\href{file\_name.pdf}{text}]
```

### 8.2.10 relsize package

Pkg relsize

For HTML, only the inline macros are supported: `\textlarger`, `\textsmaller`, and `\textscale`. Each becomes an inline span of a modified `font-size`.

`\relsize`, `\larger`, `\smaller`, and `\relscale` are ignored.

While creating SVG math for HTML, the original definitions are temporarilty restored, and so should work as expected.

⚠ not small

The HTML browser's setting for minumum font size may limit how small the output will be displayed.

## 8.3 Boxes and minipages

### 8.3.1 Marginpars

`\marginpar` `[⟨left⟩]{⟨right⟩}` `\marginpar` may contains paragraphs, but in order to remain inline with the surrounding text lwarp nullifies block-related macros inside the `\marginpar`. Paragraph breaks are converted to `<br />` tags.

`\marginparBlock` `[⟨left⟩]{⟨right⟩}` To include block-related macros, use `\marginparBlock`, which takes the same arguments but creates a `<div>` instead of a `<span>`. A line break will occur in the text where the `\marginBlock` occurs.

### 8.3.2 Save Boxes

⚠ HTML corrupted

⚠ boxes

TEX boxes are placed inline and do not allow line breaks, so boxes with long contents may overflow the line during HTML conversion. lwarp uses methods which help avoid this problem.

⚠ minipage, \parbox

`\savebox` and related do not (yet) support `minipage` or `\parbox`.

### 8.3.3 Minipages

⚠ inline

A line of text with an inline `minipage` or `\parbox` will have the `minipage` or `\parbox` placed onto its own line, because a paragraph is a block element and cannot be made `inline-block`.

placement

`minipages` and `\parboxes` will be placed side-by-side in HTML unless you place a `\newline` between them.

side-by-side

Side-by-side `minipages` may be separated by `\quad`, `\qquad`, `\enskip`, `\hspace`, `\hfill`, or a `\rule`. When inside a `center` environment, the result is similar in print and HTML. Paragraph tags are suppressed between side-by-side `minipages` and these spacing commands, but not at the start or end of the paragraph.

⚠ minipage in a span

There is limited support for `minipages` inside an HTML `<span>`. An HTML `<div>` cannot appear inside a `<span>`. While in a `<span>`, `minipages`, and `\parboxes`, and any enclosed lists have limited HTML tags, resulting in an "inline" format, without markup except for HTML breaks. Use `\newline` or `\par` for an HTML break.

⚠ minipage size

When using `minipage`, `\parbox`, and `fminipage`, a virtual $6 \times 9$ inch text area is used for `\linewidth`, `\textwidth`, and `\textheight`, both for sizing the minipage, and also for its contents.

if width is `\linewidth`

If a `minipage` or `\parbox` is assigned a width of exactly `\linewidth`, in HTML it is automatically given no HTML width, thus allowed to fill the line as needed, similar to how it appears in print output.

full-width if HTML

A new macro `\minipagefullwidth` requests that, during HTML output, the next single `minipage` or `\parbox` be generated without an HTML `width` attribute, allowing it to be the full width of the display rather than the declared print-output width. This may be useful where the printed version's width makes no sense in HTML.

⚠ `tabular`, `multicols`

`\UseMinipageWidths`
`\IgnoreMinipageWidths`

Inside a `tabular` or `multicols` environment, where the width depends on the browser window, `\minipagefullwidth` is effectively used by default for every `minipage` or `\parbox` inside the environment. `\UseMinipageWidths` may be used to tell lwarp to honor the specified widths of all following `minipages` and `\parboxes` until the end of the local scope, and `\IgnoreMinipageWidths` may be used to tell lwarp to ignore the specified widths.

⚠ multicol

Inside a `multicols`, `\linewidth` is divided by the specified number of columns.

⚠ text alignment

Nested `minipages` adopt their parent's text alignment in HTML, whereas in regular LaTeX PDF output they do not. Use a `flushleft` or similar environment in the child `minipage` to force a text alignment.

### 8.3.4 Side-by-side minipages

Place side-by-side minipages inside a `center` environment, with horizontal space between them, such as `\quad`, `\qquad`, `\hspace`, or `\hfill`. The result is similar in print and HTML. Do not use space commands at the start or end of the line.

### 8.3.5 Framed minipages and other environments

`\fbox` can only be used around inline `<span>` items during HTML output, but HTML cannot place a block element such as a `<div>` for a minipage or a list inside of a `<span>`. Several options are provided for framing an object, depending on which kind of object and which packages are loaded:

`\fbox`
`\fboxBlock`
Env `fminipage`

For a framed object, options include:

**To remove the frame in HTML output:** Place the `\fbox` command and its closing brace inside `warpprint` environments. This will nullify the frame for HTML output.

For inline text:

**To frame the contents inline with some formatting losses in HTML:** This is the default action of `\fbox` when enclosing a minipage. During HTML output, `\fbox` nullifies the HTML tags for `minipage`, `\parbox`, and lists. The contents are included as inline text inside the `\fbox`'s `<span>` of class `framebox`. For lists, line breaks are converted to HTML breaks. The result is a plain-text inline version of the contents, framed inline with the surrounding text, but lacking any extra HTML markup.

For inline `minipage` and lists:

**To frame the contents on their own line with improved formatting in HTML:** A new command `\fboxBlock` is included, intended to be a direct replacement for `\fbox` for cases where the `\fbox` surrounds a minipage, table, or list. For print output, this behaves as `\fbox`. For HTML output, the contents are placed inside an HTML `<div>` with the class `framed`, resulting in the contents being placed on their own line with a frame surrounding them. The contents preserve their HTML formatting, so lists and minipages look nicer, and valid HTML is created for a `tabular`. While an `\fbox` containing a `tabular` is valid LaTeX code, the result in HTML is problematic since a table is a `<div>` not a `<span>`, so use `\fboxBlock` around a `tabular`, or else place the `tabular` inside a `minipage`, or use `fminipage`, described next. Also see below regarding the "Misplaced alignment tab character &." error.

For display `tabular`, minipages, and lists:

**To create a framed minipage in both print and HTML:** A new environment `fminipage` is included. For print output, this is identical to `minipage`, except that it is also framed. For HTML output, this forms a `<div>` of class `framed`, the contents preserve their HTML formatting, and valid HTML is created for a `tabular`. Also see section 88 for a new environment `fcolorminipage`. Also see below regarding the "Misplaced alignment tab character &." error.

colored boxes and frames:

**To create colored frames and boxes:** See section 650 for xcolor's `\colorbox` and `\fcolorbox`, and lwarp's additional `\colorboxBlock` and `\fcolorboxBlock`.

⚠ Misplaced alignment tab character &

**To frame tables or verbatim environments:** Place the contents inside a `fminipage`, or perhaps a `\fboxBlock` for a `tabular`. Also, if using `\fboxblock` with `tabular`, you will have to use `\StartDefiningTabulars` before the start of the macro which uses `\fboxBlock` and the `tabular`, and `\StopDefiningTabulars` afterwards. Also see the lwarp documentation for the fancybox package.

**To frame equations:** See section 251 for the fancybox package.

**For fancy framed minipages:** See packages boxedminipage, shadow, fancybox, framed, mdframed.

**Custom environments:** Use a custom environment to create a sidebar, containing a `BlockClass` environment with custom CSS formatting, and `\warpprintonly{\hrule}` command:

```
\begin{BlockClass}{frameminipage}% ignored in print output
  % use \CSS\ to format div class framedminipage
\warpprintonly{\hrule} % only appears in print output
Contents
\warpprintonly{\hrule} % only appears in print output
\end{BlockClass}
```

### 8.3.6 fancybox package

Pkg fancybox

framed equation example

fancybox's documentation has an example FramedEqn environment which combines math, \Sbox, a minipage, and an \fbox. This combination requires that the entire environment be enclosed inside a lateximage, which is done by adding \lateximage at the very start of FramedEqn's beginning code, and \endlateximage at the very end of the ending code. Unfortunately, the HTML alt attribute is not used here.

```
\newenvironmentFramedEqn
{
\lateximage% NEW
\setlength{\fboxsep}{15pt}
. . . }{. . .
\[\fbox{\TheSbox}\]
\endlateximage% NEW
}
```

framing alternatives

\fbox works with fancybox. Also see lwarp's \fboxBlock macro and fminipage environment for alternatives to \fbox for framing environments.

framed table example

The fancybox documentation's example of a framed table using an \fbox containing a tabular does not work with lwarp, but the FramedTable environment does work if \fbox is replaced by \fboxBlock. This method does lose some HTML formatting. A better method is to enclose the table's contents inside a fminipage environment. The caption may be placed either inside or outside the fminipage:

```
\begin{table}
\begin{fminipage}{\linewidth}
\begin{tabular}{lr}
. . .
\end{tabular}
\end{fminipage}
\end{table}
```

⚠ framed verbatim

lwarp does not support the verbatim environment inside a span, box, or fancybox's \Sbox, but a verbatim may be placed inside a fminipage. The fancybox documentation's example FramedVerb may be defined as:

```
\newenvironment{FramedVerb}[1] % width
{
  \VerbatimEnvironment
  \fminipage{#1}
  \beginVerbatim
}{
  \endVerbatim
  \endfminipage
}
```

framed \VerbBox

fancybox's \VerbBox may be used inside \fbox.

indented alignment

LVerbatim, \LVerbatimInput, and \LUseVerbatim indent with horizontal space which may not line up exactly with what *pdftotext* detects. Some lines may be off slightly in their left edge.

### 8.3.7 mdframed package

Pkg mdframed

support Most basic functionality is supported, including frame background colors and single-border colors and thickness, title and subtitle background colors and borders and thickness, border radius, and shadow. CSS classes are created for mdframed environments and frame titles.

⚠ loading When used, lwarp loads mdframed in HTML with `framemethod=none`.

font For title font, use

```
frametitlefont=\textbf,
```

instead of

```
frametitlefont=\bfseries,
```

where `\textbf` must appear just before the comma and will receive the following text as its argument (since the text happens to be between braces in the mdframed source). Since lwarp does not support `\bfseries` and friends, only one font selection may be made at a time.

theoremtitlefont `theoremtitlefont` is not supported, since the following text is not in braces in the mdframed source.

ignored options `userdefinedwidth` and `align` are currently ignored.

css classes Environments created or encapsulated by mdframed are enclosed in a `<div>` of class `mdframed`, and also class `md<environmentname>` for new environments.

Frame titles are placed in a `<div>` of class |mdframedtitle|. Subtitles are in a `<div>` of class |mdframedsubtitle|, and likewise for subsubtitles.

### 8.3.8 tcolorbox package

Pkg tcolorbox

tcolorbox is emulated for HTML and MathJax, and supported as-is inside a `lateximage` or SVG math.

What has been tested to work (at least partly) includes:

- `tcolorbox`, `\tcbox`.
- Title, subtitle.
- Upper, lower parts.
- Colors and title fonts.
- Floating objects.
- Some layered box features.
- Counters, labels, references.
- listings, listingsutf8.
- `theorems`: Theorems are supported. `math`, `ams equation`, etc. are not supported. Use a `tcolorbox` with regular math inside it. `\tcboxmath` and `\tcbhighmath` are suppored in SVG math, and emulated in MathJax.

⚠ math

- Fitting features: `\tcboxfit` becomes `\tcbox` in HTML.

⚠ footnotes

- Footnote numbering does not match the printed output.
- MathJax emulation is provided for common macros.

⚠ undefined references

If using cleveref, it may be necessary to name theorems such as:

```
\crefname{tcb@cnt@mytheo}{my theorem}{my theorems}
```

## 8.4 Section names

If using named HTML files, by selecting `\booltrue{FileSectionNames}`, the generated filenames may be simplified by using `\FilenameSimplify` and `\FilenameNullify`:

`\FilenameSimplify` {⟨*text*⟩}

To remove common short words from the automatically-generated filenames, replacing each with a single hyphen "-", use `\FilenameSimplify`:

```
\FilenameSimplify*{-in-}
\FilenameSimplify*{A-}
```

The first example removes the word "in" in the middle of a filename, and the second example removes "A" at the start of the filename. The star forces the arguments to be detokenized, which is required for a plain-text comparison. (The unstarred form is used for a token-sensitive comparison, which is seldom required by the user.) After simplfication, repeated hyphen characters will be further simplified to a single hyphen "-". Finally, single hyphens at the start or end of the filename are removed.

`\FilenameNullify` {⟨*macros*⟩}

⚠ macros in section names

Macro names may appear in the automatically-generated file names. To remove these, create *non-robust* nullified versions of the macros, ensuring that each line ends with a percent character % as shown below. These are placed inside `\FilenameNullify`, which adds them to the list of macros which are nullfiied during filename generation. Low-level macros such as `\begingroup` will cause problems when nullfied. Many macros such as `\textbf` are already nullfied. lwarp also already nullifies built-in symbol and textcomp macros, including if defined by xunicode, but not all xunicode macros. See the definition of `\LWR@nullfonts` for a complete list.

```
\FilenameNullify{%
  \renewcommand*{\macroname}[1]{#1}%
  \renewcommand*{\anothermacro}{}%
}
```

⚠ duplicate filename

Avoid duplicate file names. Section names at levels which result in HTML file splits must be unique. lwarp will generate an error if a duplicate HTML filename is generated. Use the optional TOC caption entry parameter for formatting. Remember to `\protect` LaTeX commands which appear in section names and TOC captions.

⚠ math in section names

If using named HTML files, in section names use paren math `\(x+y\)` instead of dollar math `$x+y$`. (Dollar math works, but appears in the filename.) Or, use a short name for the TOC entry without the math, or use `\texorpdfstring` from the hyperref package:

```
\section{Some math \texorpdfstring{$1+2=3$}{three}}
```

## 8.5 Cross-references

labels
⚠ label characters

Labels with special characters may be a problem. It is best to stick with alpha-numeric, hyphen, underscore, and perhaps the colon (if not French).

\nameref
⚠ empty link

\nameref refers to the most recently-used section where the \label was defined. If no section has been defined before the \label, the link will be empty. Index entries also use \nameref and have the same limitation.

### 8.5.1 Page references

⚠ LaTeX page numbers

The printed page does not translate to the HTML page, so \pageref references are converted to parentheses containing \pagerefPageFor, which defaults to "see ", followed by a hyperlink to the appropriate object.

Ex:

```
\ref{sec:name} on page \pageref{sec:name}
```

in HTML becomes:

"Sec. 1.23 on page (**see** sec. 1.23)".

\pagerefPageFor may be redefined to "page for ", empty, etc. See page 504.

### 8.5.2 cleveref and varioref packages

Pkg cleveref
Pkg varioref
⚠ cleveref page numbers

cleveref and varioref are supported, but printed page numbers do not map to HTML, so a section name or a text phrase are used for \cpageref and \cpagerefrange. This phrase includes \cpagerefFor, which defaults to "for".

Ex:

```
\cpageref{tab:first,tab:second}
```

in html becomes:

"pages **for** table 4.1 and **for** table 4.2"

See \cpagerefFor at page 733 to redefine the message which is printed for page number references.

⚠ varioref types

cleveref changes the behavior of varioref in that the reference type is automatically printed if cleveref is loaded. Lwarp requires cleveref, so the HTML version will always automatically print the reference types even if the print mode does not. The simplest way to make them match is to require the cleveref package for the document.

### 8.5.3 Hyperlinks, hyperref, and url

Pkg hyperref
Pkg url

lwarp emulates hyperref, including the creation of active hyperlinks, but does not require that hyperref be loaded by the document.

⚠ comments between arguments

Do not place a comment with a % character between arguments for \hyperref, etc., as it is neutralized for inclusion in HTML URLs.

lwarp can also load url, but url should not be used at the same time as hyperref, since they both define the `\url` command. lwarp does not (yet) attempt to convert url links into hyperlinks during HTML output, nor does the print version of url create hyperlinks.

⚠ backref When generating HTML, lwarp's emulation of hyperref does not automatically load backref, so backref must be loaded explicitly.

### 8.5.4 Footnotes, endnotes, and page notes

lwarp uses native LaTeX footnote code, although with its own `\box` to avoid the LaTeX output routine. The usual functions mostly work as-is.

footnote numbering To have footnote numbers reset each time footnotes are printed:

```
\setcounter{footnoteReset}{1}
```

For bigfoot, manyfoot, or perpage:

```
\MakePerPage{footnoteX}
— or —
\MakeSortedPerPage{footnoteX}
```

The footnotes are reset when they are printed, according to section level as set by `FootnoteDepth`, which is not necessarily by HTML page. This is recommended for `\alph`, `\Alph`, or `\fnsymbol` footnotes, due to the limited number of symbols which are available.

⚠ MathJax, `\footnotemark` If using MathJax, after each math expression with a `\footnotemark`, adjust the `footnote` counter by the number of `\footnotemarks`:

```
\[ (math expression with two instances of \footnotemark) \]
\warpHTMLonly{\addtocounter{footnote}{2}}
```

Similarly for endnotes, but *not* sidenotes.

Also for MathJax, `\footnotename` is used for a `\footnotemark` if the actual footnote number is not known. To redefine it, provide it before loading lwarp:

```
\providecommand{\footnotename}{something}
\usepackage{lwarp}
```

Similar for sidenotes. For endnotes:

```
\def\endnotename{something}% \def allows name to start with "end"
```

For the pagenote package, there is no `\pagenotename` to define, since there is no `\pagenotemark` command.

footmisc The footmisc `stable` option is emulated by lwarp.

⚠ sectioning commands When using footnotes in sectioning commands, to generate consistent results between print and HTML, use the footmisc package with the `stable` option, provide a short TOC entry, and `\protect` the `\footnote`:

```
\usepackage[stable]{footmisc}
. . .
\subsection[Subsection Name]
    {Subsection Name\protect\footnote{A footnote.}}
```

memoir with footmisc
⚠ memoir

If using memoir class, with which lwarp preloads footmisc, the `stable` option must be declared before lwarp is loaded:

```
\PassOptionsToPackage{stable}{footmisc}
\usepackage{lwarp}
. . .
```

Do not use a starred sectioning command. As an alternative, it may be possible to adjust `\secnumdepth` instead.

fancybox, fancyvrb
⚠ `\VerbatimFootnotes`
⚠ sectioning or displaymath

If using fancybox or fancyvrb with `\VerbatimFootnotes`, and using footnotes in a sectioning command or display math, use `\footnotemark` and `\footnotetext`:

```
\subsection[Subsection Name]
    {Subsection Name\protect\footnotemark}
\footnotetext{A footnote with \verb+verbtim+.}
```

and likewise for equations or display math.

At present there is a bug such that paragraph closing tags are not present in footnotes when `\VerbatimFootnotes` are selected. The browser usually compensates.

pfnote
⚠ pfnote numbers

While emulating pfnote, lwarp is not able to reset HTML footnote numbers per page number to match the printed version, as HTML has no concept of page numbers. lwarp therefore uses continuous footnote numbering even for pfnote.

bigfoot, manyfoot
⚠ verbatim

Verbatim footnotes are not yet supported.

If using the bigfoot package, and possibly also manyfoot, problems may occur with counter allocation because lwarp uses many counters, and there is a difference in how counters numbered 256 and up are handled in pdfLaTeX. With bigfoot this has been known to show up as an error related to one footnote insert being forbidden inside another. Another problem showed up as a input stack error, and which of these problems occurred depended on how many counters were allocated.

As a possible solution, try creating several new counters before defining bigfoot or manyfoot footnotes, hoping to shift the problematic counter above the 256 threshold. It may instead be necessary to use XeLaTeX or LuaLaTeX instead of pdfLaTeX.

### 8.5.5 xr, xr-hyper, and xcite packages

See section 5.17.

## 8.6 Front and back matter

### 8.6.1 Custom classes with multiple authors and affiliations

Some classes allow multiple authors and affiliations. Often it is possible to emulate these using a standard class along with authblk:

```
%\documentclass{customclass} % for print document
\documentclass{article} % for html document

\usepackage{lwarp}
\begin{warpHTML}
\usepackage{authblk}
\let\affiliation\affil % maybe required
\end{warpHTML}
```

### 8.6.2 Starred chapters and sections

HTML page and TOC

The following describes \ForceHTMLPage and \ForceHTMLTOC, which may be used for endnotes, glossaries, tocbibind, bibliographies, and the index. See the following sections where applicable. Continue here if interested in the reason for adding these commands to lwarp.

Some packages use \chapter* or \section* to introduce reference material such as notes or lists, often to be placed in the back matter of a book. These starred sections are placed inline instead of on their own HTML pages, and they are not given TOC entries.

lwarp provides a method to cause a starred section to be on its own HTML page, subject to FileDepth, and also a method to cause the starred section to have its own TOC entry during HTML output.

\ForceHTMLPage

To place a starred section on its own HTML page, use \ForceHTMLPage just before the \chapter* or \section*. lwarp will create a new page for the starred sectional unit.

A starred sectional unit does not have a TOC entry unless one is placed manually. The typical method using \phantomsection and \addcontentsline works for inline text but fails when the new starred section is given its own webpage after the TOC entry is created, or when creating an EPUB where the TOC entry will point to the page before the starred section. If the starred section has its own HTML page but no correct TOC entry pointing to that page, the page will be inaccessible unless some other link is created.

⚠ inaccessible HTML page

\ForceHTMLTOC

To automatically force the HTML version of the document to have a TOC entry for a starred section, use \ForceHTMLTOC just before the \chapter* or \section*, and place \phantomsection and \addcontentsline inside a warpprint environment.

For print output, \ForceHTMLTOC and \ForceHTMLPage have no effect.

### 8.6.3 abstract package

Pkg abstract

If using the number option with file splits, be sure to place the table of contents before the abstract. The number option causes a section break which may cause a file split, which would put a table of contents out of the home page if it is after the abstract.

⚠ missing TOC

### 8.6.4 titling and authblk

Pkg titling
Pkg authblk
package support
⚠ load order
\published and \subtitle

lwarp supports the native LaTeX titling commands, and also supports the packages authblk and titling. If both are used, authblk should be loaded before titling.

If using the titling package, additional titlepage fields for \published and \subtitle may be added by using \AddSubtitlePublished in the preamble. See section 68.8.

### 8.6.5 tocloft package

Opt [tocloft] titles
Pkg tocloft
Pkg tocloft
⚠ tocloft & other packages

If using tocloft with tocbibind, anonchap, fncychap, or other packages which change chapter title formatting, load tocloft with its titles option, which tells tocloft to use standard LaTeX commands to create the titles, allowing other packages to work with it.

### 8.6.6 appendix package

Pkg appendix
⚠ incorrect TOC link

During HTML conversion, the option toc without the option page results in a TOC link to whichever section was before the appendices environment. It is recommended to use both toc and also page at the same time.

### 8.6.7 pagenote package

Pkg pagenote

pagenote works as-is, but the page option is disabled.

⚠ labels

Note that labels in page notes do not appear as expected, even in the print version.

### 8.6.8 endnotes package

Pkg endnotes
table of contents

To place the endnotes in the TOC, use:

```
\usepackage{endnotes}
\appto\enoteheading{\addcontentsline{toc}{section}{\notesname}}
\renewcommand*{\notesname}{Endnotes} % optional
```

HTML page

To additionally have the endnotes on their own HTML page, if FileDepth allows:

```
\ForceHTMLPage
\theendnotes
```

⚠ \endnotemark numbering

If using MathJax, see section 8.5.4 regarding the use of \endnotemark and \endnotetext.

### 8.6.9 *BibTeX*

\etalchar

Displays a superscript "+" to indicate "and others".

⚠ Modify *.bib

When enough authors are cited for a source, BibTeX may use the \etalchar command to

display a math superscript with a + character to indicate "and others". Without modification, this will result in an "Improper \prevdepth" error. At present, lwarp requires that \etalchar be replaced by a text superscript. To do so, add to the start of the .bib file the following:

```
@PREAMBLE{"\let\etalchar\relax \newcommand{\etalchar}[1]{\textsuperscript{#1}}"}
```

### 8.6.10 xcite package

See section 5.17.

### 8.6.11 gloss package

Pkg gloss

⚠ compiling

To process the HTML glossary:

```
bibtex <projectname>_html.gls
```

### 8.6.12 glossaries package

Pkg glossaries

processing glossaries

Opt GlossaryCmd

Default: makeglossaries

Opt [lwarpmk] printglossary

Opt [lwarpmk] htmlglossary

⚠ *makeglossaries* not found

*lwarpmk* has the commands **lwarpmk printglossary** and **lwarpmk htmlglossary**, which process the glossaries created by the glossaries package using that package's *makeglossaries* program.

The shell command to execute is set by the lwarp option GlossaryCmd, which defaults to **makeglossaries**. The print or HTML glossary filename is appended to this command.

In some situations it may be required to modify the default command, such as to add the **perl** command in front:

```
\usepackage[
   GlossaryCmd={perl makeglossaries},
] {lwarp}
```

*xindy* language

To set the language to use for processing glossaries with *xindy*:

```
\usepackage[
   GlossaryCmd={makeglossaries -L english},
] {lwarp}
```

Other options for *makeglossaries* may be set as well.

placement and TOC options

The glossaries may be placed in a numbered or unnumbered section, given a TOC entry, and placed inline or on their own HTML page:

**Numbered section, on its own HTML page:**

```
\usepackage[xindy,toc,numberedsection=nolabel]{glossaries}
. . .
\printglossaries
```

**Unnumbered section, inline with the current HTML page:**

```
\usepackage[xindy,toc]{glossaries}
. . .
\printglossaries
```

**Unnumbered section, on its own HTML page:**

```
\usepackage[xindy,toc]{glossaries}
. . .
\ForceHTMLPage
\printglossaries
```

⚠ glossary style — The default `style=item` option for glossaries conflicts with lwarp, so the style is forced to `index` instead.

⚠ number list — The page number list in the printed form would become `\namerefs` in HTML, which could become a very long string if many items are referenced. For now, the number list is simply turned off.

print/HTML versions — The print and HTML versions of the glossary differ in their internal page numbers. Separate commands for generating print and HTML glossaries are used, even though the page number is currently ignored.

### 8.6.13 nomencl package

Pkg nomencl — To process the HTML nomenclature:

```
makeindex <project>_html.nlo -s nomencl.ist -o <project>_html.nls
```

### 8.6.14 Indexing overview

There are many ways to process indexes for a LaTeX document, including native LaTeX capabilities, a number of packages and classes, the possible availability of shell escape and *latexmk*, and the need to process print and HTML versions. lwarp attempts to provide easy recompilation of indexes along with the rest of the document, but the various indexing options must be set correctly. Numerous examples are given below. Some differ in minor details, so the important parts are highlighted in red, and options are in green.

Once set up properly, the entire document may be recompiled with **`lwarpmk print`** and **`lwarpmk html`**. In some cases, it will also be necessary to compile the indexes with **`lwarpmk printindex`** and **`lwarpmk htmlindex`**. A recompile may then be forced with **`lwarpmk print1`** and **`lwarpmk html1`**.

manual processing — The user may continue to process indexes manually or by shell script without the use of *lwarpmk*, but adjustments will be required to process HTML indexes as well. In general, `*.idx` and `*.ind` files will be accompanied by `*_html.idx` and `*_html.ind` files.

custom index style — If using a custom indexing style file, see sections 8.6.20 to 8.6.22.

link appearance — To control how the index links appear in the HTML output, see the `IndexRef` option in section 7.5, page 107.

source code — See section 78 for lwarp's core index and glossary code, section 330 for index, section 552

for splitidx, section 328 for imakeidx, section 605 for tocbibind, and section 671.17 for memoir's indexing patches.

### 8.6.15 Indexing with makeidx, *makeindex*, *xindy*, *xindex*, gindex

*lwarpmk* processing

The following allow the user to process indexes automatically, or using *lwarpmk*'s commands:

Enter ⇒ **`lwarpmk printindex`**

Enter ⇒ **`lwarpmk htmlindex`**

Prog makeindex

**For a single index using *makeindex*:**

```
\usepackage[makeindex,latexmk] {lwarp}
```

The usual `.idx` and `.ind` files will be used, along with the new `lwarp.ist` style file. When creating the HTML index, "`_html`" is automatically appended to each of the names.

*lwarpmk* will use *latexmk* if specified, in which case *latexmk* will create the index automatically. Otherwise, use

Enter ⇒ **`lwarpmk printindex`**

Enter ⇒ **`lwarpmk htmlindex`**

to compile the indexes.

To use a custom configuration file, see section 8.6.20.

Prog xindy

**For a single index using *xindy*:**

```
\usepackage[
    xindy,
    xindyLanguage=english,                  <optional>
    xindyCodepage=utf8,                     <optional>
    latexmk                                 <optional>
]{lwarp}
```

The usual `.idx` and `.ind` files will be used, along with the new `lwarp.xdy` style file.

*lwarpmk* will use *latexmk* if specified, in which case *latexmk* will create the index automatically. Otherwise, use

Enter ⇒ **`lwarpmk printindex`**

Enter ⇒ **`lwarpmk htmlindex`**

to compile the indexes.

To use a custom configuration file, see section 8.6.21.

Prog xindex **For a single index using *xindex*:**

```
\usepackage[
    xindex,
    latexmk                                    <optional>
]{lwarp}
```

The usual `.idx` and `.ind` files will be used.

*lwarpmk* will use *latexmk* if specified, in which case *latexmk* will create the index automatically. Otherwise, use

Enter ⇒ **`lwarpmk printindex`**

Enter ⇒ **`lwarpmk htmlindex`**

to compile the indexes.

To use a custom configuration file, see section 8.6.22.

Pkg gindex **For a single index using gindex:**

```
\usepackage[
    makeindex,
    makeindexStyle=gindex.ist,
    . . . or . . .
    makeindexStyle=gindexh.ist,
    latexmk                                    <optional>
]{lwarp}
```

The usual `.idx` and `.ind` files will be used.

*lwarpmk* will use *latexmk* if specified, in which case *latexmk* will create the index automatically. Otherwise, use

Enter ⇒ **`lwarpmk printindex`**

Enter ⇒ **`lwarpmk htmlindex`**

to compile the indexes.

To use a custom configuration file, copy `gindex.ist` to a new file, modify, then specify it with `MakeindexStyle` as above. lwarp will automatically adapt to gindex's `\indexpagessep` and `\indexrangesep` settings.

### 8.6.16 Indexing with index

Prog index

lwarp is told how to use *makeindex* using the `PrintIndexCmd` and `HTMLIndexCmd` options. The file `lwarp.ist` is specified, which generates index letter heads for print output and also allows special HTML formatting for HTML output.

**For multiple indexes using *makeindex* and** index**:**

(Assuming that the second index has file extensions `.sist` and `.sind`)

```
\usepackage[
  makeindex, latexmk,
  PrintIndexCmd={
    makeindex -s lwarp.ist <projectname>.idx ;
    makeindex -s lwarp.ist
      -o <projectname>.sind <projectname>.sidx
  },
  HTMLIndexCmd={
    makeindex -s lwarp.ist <projectname>_html.idx ;
    makeindex -s lwarp.ist
      -o <projectname>_html.sind <projectname>_html.sidx
  }
]{lwarp}
\usepackage{index}
. . .
\makeindex
\newindex{secondname}{sidx}{sind}{Second Index}
```

⚠ Windows *For Windows, replace the two ";" characters with "&".*

When creating the HTML index, "`_html`" is automatically appended to the index filenames.

Use

Enter ⇒ **`lwarpmk printindex`**

Enter ⇒ **`lwarpmk htmlindex`**

to compile the indexes.

If the `latexmk` option is selected for lwarp, *latexmk* will compile the document but will *not* compile the indexes. **`lwarpmk printindex`** and **`lwarpmk htmlindex`** will still be required.

### 8.6.17 Indexing with splitidx

Prog `splitidx`

lwarp is told how to use *splitindex* using the `PrintIndexCmd` and `HTMLIndexCmd` options. The file `lwarp.ist` is specified, which generates index letter heads for print output and also allows special HTML formatting for HTML output.

If the `latexmk` option is selected for lwarp, *latexmk* will compile the document but will *not* compile the indexes. **`lwarpmk printindex`** and **`lwarpmk htmlindex`** will still be required.

⚠ `\thepage` When using `\AtWriteToIndex` or `\AtNextWriteToIndex`, the user must not refer to `\thepage` during HTML output, as the concept of a page number is meaningless. Instead, do

```
\addtocounter{LWR@autoindex}{1}
\LWR@new@label{LWRindex-\arabic{LWR@autoindex}}
```

where the \index-like action occurs, and then refer to \arabic{LWR@autoindex} instead of \thepage where the reference should occur.

See section 671.17 in the lwarp-patch-memoir package for the \@@wrspindexhyp macro as an example.

**For multiple indexes using *makeindex* and splitidx:**

```
\usepackage[
  makeindex, latexmk,
  PrintIndexCmd={
    splitindex <projectname> -- -s lwarp.ist
  },
  HTMLIndexCmd={
    splitindex <projectname>_html -- -s lwarp.ist
  }
]{lwarp}
\usepackage{splitidx}
. . .
\makeindex
\newindex[Second Index]{secondname}
```

When creating the HTML index, "_html" is automatically appended to each of the names.

Use

Enter ⇒ **lwarpmk printindex**

Enter ⇒ **lwarpmk htmlindex**

to compile the indexes.

**For multiple indexes using *xindy* and splitidx:**

```
\usepackage[
  xindy, latexmk,
  PrintIndexCmd={
    splitindex -m xindy <projectname> -- -M lwarp.xdy
      -L english -C utf8                          <optional>
  },
  HTMLIndexCmd={
    splitindex -m xindy <projectname>_html -- -M lwarp.xdy
      -L english -C utf8                          <optional>
  }
]{lwarp}
\usepackage{splitidx}
. . .
\makeindex
\newindex[Second Index]{secondname}
```

When creating the HTML index, "_html" is automatically appended to each of the names.

Use

Enter ⇒ **lwarpmk printindex**

Enter ⇒ **lwarpmk htmlindex**

to compile the indexes.

### 8.6.18 Indexing with imakeidx

Prog imakeidx

Due to the number of methods which may be used to process multiple indexes, the options for style file and *xindy* language and codepage must be specified in one of several different ways. These are described in detail later in this section, but are summarized here.

If shell escape is used, imakeidx will automatically compile the indexes by itself. Options specifying a custom style file and *xindy* language and codepage must be specified for each `\makeindex` command using its `options=` option, which must include lwarp's special `lwarp.ist` or `lwarp.xdy` file, or a file based on them. If using a custom indexing style file, see sections 8.6.20 to 8.6.22.

The `splitindex` option is also available of shell escape is used, in which case the splitidx package and *splitindex* program will also be used.

If shell escape is not possible, *latexmk* may be used to automatically compile the indexes. The style, language, and codepage options are specified with lwarp's `makeindexStyle`, `xindyStyle`, `xindyLanguage`, and `xindyCodepage` options. These are passed to *latexmk* by *lwarpmk*'s **lwarpmk printindex** and **lwarpmk htmlindex** commands.

Where shell escape and *latexmk* are not possible, *lwarpmk* may be used to manually compile the indexes. lwarp's `PrintIndexCmd` and `HTMLIndexCmd` options are used.

**For a single or multiple indexes using *makeindex* and imakeidx:**

The index style `lwarp.ist` is automatically used for HTML output. This file turns on letter headings, so it may be desirable to specify it as an option, in which case it will also be used for print output, which will help match the print and HTML output.

```
\usepackage[makeindex,latexmk] {lwarp}
\usepackage[makeindex]{imakeidx}
. . .
\makeindex[options={-s lwarp.ist}]
\makeindex[name=secondname,options={-s lwarp.ist}]
```

imakeidx will automatically compile the indexes. Shell escape is not required while using *makeindex*. `latexmk` may be specified, and if so it will be used for **lwarpmk print** and **lwarpmk html**, but *imakeidx* will actually create the indexes.

**For a single or multiple indexes using *makeindex* and *splitindex* with imakeidx:**

The index style `lwarp.ist` is automatically used for HTML output. This file turns on letter headings, so it may be desirable to specify it as an option, in which case it will also be used for print output, which will help match the print and HTML output.

```
\usepackage[makeindex,latexmk] {lwarp}
\usepackage[makeindex,splitindex]{imakeidx}
. . .
\makeindex[options={-s lwarp.ist}]
\makeindex[name=secondname,options={-s lwarp.ist}]
```

⚠ enable shell escape

Shell escape is required while using *splitindex*. For the first compile, use

Enter ⇒ **pdflatex --shell-escape projectname.tex**

Enter ⇒ **pdflatex --enable-write18 projectname.tex** **(MiKTeX)**

or similar with *xelatex* or *lualatex*. lwarp will remember that shell escape was used.

*imakeidx* will automatically execute *splitindex*, and will also use *makeindex* to compile the indexes.

`latexmk` may be specified, and if so it will be used for **`lwarpmk print`** and **`lwarpmk html`**, but *imakeidx* will actually create the indexes.

**For multiple indexes using *xindy* and** imakeidx**, using shell escape:**

Options may be given to imakeidx's `\makeindex` command. The style file `lwarp.xdy` is automatically used for HTML output, and is not necessary for print output since the output will be similar. If language or codepage must be set, they should be specified as options for `\makeindex`, since imakeidx will process the indexes.

```
\usepackage[xindy,latexmk] {lwarp}
\usepackage[xindy,splitindex]{imakeidx}
. . .
\makeindex[
  options={ -M lwarp.xdy -L english -c utf8 }
]
\makeindex[
  name=secondname,
  options={ -M lwarp.xdy -L english -c utf8 }
]
```

⚠ enable shell escape

For the first compile, use

Enter ⇒ **pdflatex --shell-escape projectname.tex**

Enter ⇒ **pdflatex --enable-write18 projectname.tex** **(MiKTeX)**

or similar with *xelatex* or *lualatex*. lwarp will remember that shell escape was used.

*imakeidx* will automatically execute *splitindex* if selected, and will also use *xindy* to compile the indexes.

If selected, *latexmk* will automatically recompile the entire document as necessary.

**For indexes using *xindy* and *imakeidx*, without shell escape, but *with latexmk*:**

lwarp's options are used, and are passed to *latexmk*.

```
\usepackage[
  xindy,
  xindyLanguage=english,                    <optional>
  xindyCodepage=utf8,                       <optional>
  latexmk,
]{lwarp}
\usepackage[xindy]{imakeidx}
. . .
\makeindex
\makeindex[name=secondname]
```

*latexmk* will create the indexes automatically when **`lwarpmk print`** and **`lwarpmk html`** are executed.

**For indexes using *xindy* and *imakeidx*, without shell escape, and *without latexmk*:**

*lwarpmk* must be told how to create the indexes:

```
\usepackage[
  xindy,
  PrintIndexCmd={
    xindy -M lwarp.xdy -L english -C utf8
      <projectname>.idx ;
    xindy -M lwarp.xdy -L english -C utf8
      secondname.idx
  },
  HTMLIndexCmd={
    xindy -M lwarp.xdy -L english -C utf8
      <projectname>_html.idx ;
    xindy -M lwarp.xdy -L english -C utf8
      secondname_html.idx
  }
]{lwarp}
\usepackage[xindy]{imakeidx}
. . .
\makeindex
\makeindex[name=secondname]
```

⚠ Windows *For Windows, replace the two ";" characters with "&".*

<projectname> is the \jobname: if compiling "name.tex", use the filenames name.idx and name_html.idx.

Use

Enter ⇒ **lwarpmk printindex**

Enter ⇒ **lwarpmk htmlindex**

to compile the indexes.

**For multiple indexes using *xindex* and** imakeidx**, using shell escape:**

*xindex*, *makeindex*, *imakeidx*, and *splitindex* can all work together:

```
\usepackage[%
  xindex,
  xindexConfig=-imakeidx,
  latexmk
] {lwarp}
\usepackage[makeindex,splitindex]{imakeidx}
. . .
\makeindex[%
  options={ -s lwarp.ist} }
]
\makeindex[
  name=secondname,
  options={ -s lwarp.ist} }
]
```

⚠ enable shell escape For the first compile, use:

Enter ⇒ **pdflatex --shell-escape projectname.tex**

Enter ⇒ **pdflatex --enable-write18 projectname.tex** **(MiKTeX)**

or similar with *xelatex* or *lualatex*. lwarp will remember if shell escape was used.

*xindex* will use *imakeidx*, and *imakeidx* will automatically execute *splitindex* if selected.

If selected, *latexmk* will automatically recompile the entire document as necessary.

### 8.6.19 Indexes with memoir

**For a single index with memoir and *makeindex*:**

```
\documentclass{memoir}
\usepackage[makeindex,latexmk]{lwarp}
. . .
\makeindex
```

The usual `.idx` and `.ind` files will be used, along with the `lwarp.ist` style file.

*lwarpmk* will use *latexmk* if specified, in which case *latexmk* will create the index automatically. Otherwise, use

Enter ⇒ **lwarpmk printindex**

Enter ⇒ **lwarpmk htmlindex**

to compile the indexes.

**For multiple indexes with memoir and *makeindex*, using *latexmk*:**

lwarp's options are used, and are passed to *latexmk*.

```
\documentclass{memoir}
\usepackage[makeindex,latexmk]{lwarp}
. . .
\makeindex
\makeindex[secondname]
```

*lwarpmk* will use *latexmk* to create the indexes automatically when the user executes **lwarpmk print** and **lwarpmk html**.

**For multiple indexes with** memoir **and *makeindex*, *without*** latexmk**:**

*lwarpmk* must be told how to create the indexes:

```
\documentclass{memoir}
\usepackage[
  makeindex,
  PrintIndexCmd={
    makeindex -s lwarp.ist <projectname>.idx ;
    makeindex -s lwarp.ist secondname.idx
  },
  HTMLIndexCmd={
    makeindex -s lwarp.ist <projectname>_html.idx ;
    makeindex -s lwarp.ist secondname_html.idx
  }
]{lwarp}
. . .
\makeindex
\makeindex[secondname]
```

⚠ Windows *For Windows, replace the two ";" characters with "&".*

`<projectname>` is the `\jobname`: if compiling "`name.tex`", use the filenames `name.idx` and `name_html.idx`.

Use

Enter ⇒ **`lwarpmk printindex`**

Enter ⇒ **`lwarpmk htmlindex`**

to compile the indexes.

**For a single index with** memoir **and *xindy*:**

```
\documentclass{memoir}
\usepackage[
    xindy,
    xindyLanguage=english,                  <optional>
    xindyCodepage=utf8,                     <optional>
    latexmk                                 <optional>
]{lwarp}
. . .
\xindyindex
\makeindex
```

The usual `.idx` and `.ind` files will be used, along with the `lwarp.xdy` style file.

*lwarpmk* will use *latexmk* if specified, in which case *latexmk* will create the index automatically. Otherwise, use

Enter ⇒ **`lwarpmk printindex`**

Enter ⇒ **`lwarpmk htmlindex`**

to compile the indexes.

**For multiple indexes with** memoir **and *xindy*, using** latexmk**:**

lwarp's options are used, and are passed to *latexmk*.

```
\documentclass{memoir}
\usepackage[
    xindy,
    xindyLanguage=english,                    <optional>
    xindyCodepage=utf8,                       <optional>
    latexmk
]{lwarp}
. . .
\xindyindex
\makeindex
\makeindex[secondname]
```

*lwarpmk* will use *latexmk* to create the indexes automatically.

**For multiple indexes with** memoir **and *xindy*, *without*** latexmk**:**

*lwarpmk* must be told how to create the indexes:

```
\documentclass{memoir}
\usepackage[
  xindy,
  PrintIndexCmd={
    xindy -M lwarp.xdy -L english -C utf8
      <projectname>.idx ;
    xindy -M lwarp.xdy -L english -C utf8
      secondname.idx
  },
  HTMLIndexCmd={
    xindy -M lwarp.xdy -L english -C utf8
      <projectname>_html.idx ;
    xindy -M lwarp.xdy -L english -C utf8
      secondname_html.idx
  }
]{lwarp}
. . .
\xindyindex
\makeindex
\makeindex[secondname]
```

⚠ Windows *For Windows, replace the four ";" characters with "&".*

`<projectname>` is the `\jobname`: if compiling "`name.tex`", use the filenames `name.idx` and `name_html.idx`.

Use

Enter ⇒ **`lwarpmk printindex`**

Enter ⇒ **`lwarpmk htmlindex`**

to compile the indexes.

### 8.6.20 Using a custom *makeindex* style file

Prog makeindex
File lwarp.ist

When using *makeindex*, *lwarpmk* uses the file `lwarp.ist` to process the index. This file is over-written by lwarp whenever a print version of the document is processed.

To use a custom *makeindex* style file:

1. Copy `lwarp.ist` to a new filename such as `projectname.ist`
2. Make changes to `projectname.ist`. Keep the lines which refer to `\hyperindexref`. These lines creates the hyperlinks for the HTML index. During print output `\hyperindexref` becomes a null function.
3. If changing

   ```
   delim_n -and- delim_r
   ```

   in `projectname.ist`, then in the document preamble redefine

   ```
   \IndexPageSeparator -and- \IndexRangeSeparator
   ```

   to match.

Opt makeindexStyle

4. In the document source use the `makeindexStyle` option for lwarp:

   ```
   \usepackage[
     . . . other options . . .
     makeindex,
     makeindexStyle=projectname.ist,
   ]{lwarp}
   ```

   Likewise, refer to the custom style file if using `\PrintIndexCmd`, `\HTMLIndexCmd`, or `\LatexmkIndexCmd`.
5. Recompile the print version, which causes lwarp to rewrite the `lwarpmk.conf` configuration file. This tells *lwarpmk* to use the custom `projectname.ist` file instead of `lwarp.ist`.

### 8.6.21 Using a custom *xindy* style file

Prog xindy
File lwarp.xdy

When using *xindy*, *lwarpmk* uses the file `lwarp.xdy` to process the index. This file is over-written by lwarp whenever a print version of the document is processed.

To use a custom *xindy* style file:

1. Copy `lwarp.xdy` to a new filename such as `projectname.xdy`
2. Make changes to `projectname.xdy`.

   Keep the lines which refer to `\hyperindexref`:

   ```
   (define-attributes (("hyperindexref")))
   (markup-locref :open "\hyperindexref{" :close "}")
   ...
   (markup-locref :open "\textit{\hyperindexref{" :close "}}" :attr "textit")
   ```

These lines create the hyperlinks for the HTML index. During print output `\hyperindexref` becomes a null function.

To create custom styles, refer to the lines for `\textbf` and `\textit`.

3. If changing any of

```
markup-locref-list :sep
markup-locclass-list :open
markup-locclass-list :sep
markup-crossref-layer-list :sep
markup-range :sep
```

in `projectname.xdy`, then in the document preamble redefine

```
\IndexPageSeparator -and- \IndexRangeSeparator
```

to match.

Opt `xindyStyle`

4. In the document source use the `xindyStyle` option for lwarp:

```
\usepackage[
  . . . other options . . .
  xindy,
  xindyStyle=projectname.xdy,
]{lwarp}
```

Likewise, refer to the custom style file if using `\PrintIndexCmd`, `\HTMLIndexCmd`, or `\LatexmkIndexCmd`.

5. Recompile the print version, which causes lwarp to rewrite the `lwarpmk.conf` configuration file. This tells *lwarpmk* to use the custom `projectname.xdy` file instead of `lwarp.xdy`.

### 8.6.22 Using a custom *xindex* style file

Prog `xindex`

To use a custom *xindex* style file:

⚠ filename

1. Copy `xindex-cfg.lua` to a new filename such as `xindex-projectname.lua`. The filename must start with `xindex-` and end with `.lua`.

2. Make changes to `xindex-projectname.lua`.

3. If changing

```
itemPageDelimiter -and- rangeSymbol
```

in `xindex-projectname.lua`, then in the document preamble redefine

```
\IndexPageSeparator -and- \IndexRangeSeparator
```

to match.

Opt `xindexConfig`

4. In the document source use the `xindexConfig` option for lwarp:

```
\usepackage[
  . . . other options . . .
  xindex,
  xindexConfig=projectname,    % (without xindex- or .lua)
]{lwarp}
```

Likewise, refer to the custom style file if using `\PrintIndexCmd`, `\HTMLIndexCmd`, or `\LatexmkIndexCmd`.

5. Recompile the print version, which causes lwarp to rewrite the `lwarpmk.conf` configuration file. This tells *lwarpmk* to use the custom `xindex-projectname.lua` file instead of the default `xindex-cfg.lua`.

### 8.6.23 Additional indexing limitations

⚠ *xindy* with hyperref

*xindy* and hyperref may not work well together for print output with "see", "see also", reference ranges, or stylized index references. It may be necessary to turn off hyperreferencing for indexes:

```
\usepackage[hyperindex=false]{hyperref}
```

⚠ empty index

If an HTML index is empty, it may be necessary to add the following before lwarp is loaded:

```
\usepackage{morewrites}
\morewritessetup{allocate=10}
. . .
\usepackage{lwarp}
```

*makeindex* custom display styles

When using *makeindex*, custom display styles are possible:

```
\begin{warpprint}
\newcommand{\notesstyle}[1]{#1nn}
\end{warpprint}

\begin{warpHTML}
\makeatletter
\newcommand{\notesstyle}[1]{\LWR@doindexentry{#1} notes }
\makeatother
\end{warpHTML}
. . .
A sentence.\index{key|notesstyle}
```

*xindy* custom display styles

For custom styles with *xindy*, see `lwarp.xdy` for `\textbf` and `\textit` as examples.

### 8.6.24 Index positions, TOC, tocbibind

placement and TOC options

An index may be placed inline with other HTML text, or on its own HTML page:

Pkg makeidx

**Inline, with a manual TOC entry:**

A commonly-used method to introduce an index in a LaTeX document:

```
\cleardoublepage
\phantomsection
\addcontentsline{toc}{section}{\indexname}% or chapter
\printindex
```

Pkg makeidx **On its own HTML page, with a manual TOC entry:**

```
\begin{warpprint}
\cleardoublepage
\phantomsection
\addcontentsline{toc}{section}{\indexname}% or chapter
\end{warpprint}
\ForceHTMLPage
\ForceHTMLTOC
\printindex
```

Pkg tocbibind **Inline, with an automatic TOC entry:**

The tocbibind package may be used to automatically place an entry in the TOC.

```
\usepackage[nottoc]{tocbibind}
. . .
\cleardoublepage
\phantomsection % to fix print-version index link
\printindex
```

Pkg tocbibind **On its own HTML page, with an automatic TOC entry:**

```
\usepackage[nottoc]{tocbibind}
. . .
\cleardoublepage
\phantomsection % to fix print-version index link
\ForceHTMLPage
\printindex
```

Opt [tocbibind] numindex
numbered index section

Use the tocbibind `numindex` option to generate a numbered index. Without this option, the index heading has no number.

Other packages, such as imakeidx, may also have options for including the index in the Table of Contents.

Pkg tocloft
⚠ tocloft & other packages

If using tocloft with tocbibind, anonchap, fncychap, or other packages which change chapter title formatting, load tocloft with its `titles` option, which tells tocloft to use standard LaTeX commands to create the titles, allowing other packages to work with it.

## 8.7 Math

### 8.7.1 Math in section names

⚠ math in section names

If using named HTML files, in section names use paren math `\(x+y\)` instead of dollar math `$x+y$`. (Dollar math works, but appears in the filename.) Or, use a short name for the TOC entry without the math, or use `\texorpdfstring` from the hyperref package:

```
\section{Some math \texorpdfstring{$1+2=3$}{three}}
```

### 8.7.2 Rendering tradeoffs

Math rendering

Math may be rendered as SVG graphics or using the MathJax JavaScript display engine.

SVG files

Rendering math as images creates a new SVG file for each expression, except that an MD5 hash is used to combine identical duplicates of the same inline math expression into a single file, which must be converted to SVG only once. Display math is still handled as individual files, since it may contain labels or references which are likely to change.

SVG inline

The SVG images are currently stored separately, but they could be encoded in-line directly into the HTML document. This may reduce the number of files and potentially speed loading the images, but slows the display of the rest of the document before the images are loaded.

PNG files

Others LaTeX-to-HTML converters have used PNG files, sometimes pre-scaled for print resolution but displayed on-screen at a scaled down size. This allows high-quality print output at the expense of larger files, but SVG files are the preferred approach for scalable graphics.

MathML

Conversion to MathML might be a better approach, among other things allowing a more compact representation of math than SVG drawings. Problems with MathML include limited browser support and some issues with the fine control of the appearance of the result. Also see section 10 regarding EPUB output with MathJax.

### 8.7.3 svg option

SVG math option

For SVG math, math is rendered as usual by LaTeX into the initial PDF file using the current font[14], then is captured from the PDF and converted to SVG graphics via a number of utility programs. The SVG format is a scalable-vector web format, so math may be typeset by LaTeX with its fine control and precision, then displayed or printed at any size, depending on (sometimes broken) browser support. An HTML `alt` attribute carries the LaTeX code which generated the math, allowing copy/paste of the LaTeX math expression into other documents.

SVG image font size

For the `lateximage` environment, the size of the math and text used in the SVG image may be adjusted by setting `\LateximageFontSizeName` to a font size name — *without the backslash*, which defaults to:

```
\renewcommand{\LateximageFontSizeName}{normalsize}
```

For inline SVG math, font size is instead controlled by `\LateximageFontScale`, which defaults to:

```
\newcommand*{\LateximageFontScale}{.75}
```

SVG math copy/paste

For SVG math, text copy/paste from the HTML `<alt>` tags lists the equation number or tag for single equations, along with the LaTeX code for the math expression. For $\mathcal{AMS}$ environments with multiple numbers in the same environment, only the first and last is copy/pasted, as a range. No tags are listed inside a starred $\mathcal{AMS}$ environment, although the `\tag` macro will still appear inside the LaTeX math expression.

⚠ SVG math size, baseline

SVG math sizing and baselines are improved if the graphics or graphicx package is loaded. An almost-invisible marker is placed at either end of the image to assist in cropping and computing the baseline. A warning is issued at the end of the compile if graphics or graphicx are not used.

[14] See section 656 regarding fonts and fractions.

⚠ svg math in TEX boxes

svg math does not work inside TEX boxes, since a \newpage is required before and after each image.

### 8.7.4 MathJax option

MathJax math option

Prog MathJax

The MathJax (mathjax.org) LATEX-math to html converter may be used to display math.

When MathJax is enabled, math is rendered twice:

1. As regular LATEX pdf output placed inside an html comment, allowing equation numbering and cross referencing to be almost entirely under the control of LATEX, and
2. As detokenized printed LATEX commands placed directly into the html output for interpretation by the MathJax display scripts. An additional script is used to pre-set the equation number format and value according to the current LATEX values, and the MathJax equation numbering system is ignored in favor of the LATEX internal system, seamlessly integrating with the rest of the html output, including any math appearing in non-MathJax svg output.

### 8.7.5 Customizing MathJax

equation numbering

lwarp detects and adjusts MathJax equation numbering format for article and book style equations as well as amsmath \numberwithin for chapters, sections, and subsections. Custom equation number formats may be set as follows, for example:

```
\renewcommand*{\theequation}{\Alph{section}.\arabic{equation}}
\AtBeginDocument{
  \renewcommand*{\theMathJaxsection}{\Alph{section}.}
}
```

⚠ subequation

The amsmath subequations environment is supported, but only with \alpha subequation numbering.

global customizations

MathJax does not have preexisting support every possible math function. Additional MathJax function definitions may be defined in the preamble. These will be declared at the start of each html page, and thus will have a global effect across all html pages.

Examples:

```
\begin{warpMathJax}
\CustomizeMathJax{
    \newcommand{\expval}[1]{\langle#1\rangle}
    \newcommand{\abs}[1]{\lvert#1\rvert}
}
\CustomizeMathJax{\newcommand{\arcsinh}{\text{arcsinh}}}
\CustomizeMathJax{\newcommand{\arccosh}{\text{arccosh}}}
\CustomizeMathJax{\newcommand{\NN}{\mathbb{N}}}
\end{warpMathJax}
```

⚠ slow compilation

To avoid a slowdown in compile speed, use the warpMathJax environment to prevent its contents from being processed in print or svg math output. Also, place each new definition

inside its own \CustomizeMathJax. A warning to this effect is issued if an overly-long definition is attempted.

lwarp already provides MathJax customizations for some packages.

siunitx When using siunitx, a similar process may be used to add custom units:

```
\begin{warpMathJax}
\CustomizeMathJax{\newcommand{\myunit}{\mathrm{WXYZ}}}
\CustomizeMathJax{\newcommand{\umyunit}{\mathrm{\micro\myunit}}}
\end{warpMathJax}
```

advanced control For more advanced control over dynamically creating custom definitions, see as an example the lwarp definition for \DeclarePairedDelimiterX, in section 386, mathtools.

local customizations For customizations local to the current HTML page only, macros may be defined as follows:

```
\begin{warpMathJax}
\( \newcommand{\macroname}{. . . } \)
\( \newcommand{\anothername}{. . . } \)
\end{warpMathJax}
```

To maintain compile speed, use the warpMathJax environment, and use a separate math environment for each definition.

\ifstar For MathJax, use \ifstar instead of \@ifstar:

```
\CustomizeMathJax{
  \def\myname{
    \ifstar\starredaction\unstarredaction
    % (Do not place anything after!)
  } }
```

\ifnextchar For MathJax, use \ifnextchar instead of \@ifnextchar:

```
\CustomizeMathJax{\def\myname{\ifnextchar X \found\notfound}}
```

"X" may be a single ASCII character, or a hex number inside braces, ex:

```
\CustomizeMathJax{\def\myname{\ifnextchar{0x7B}\found\notfound}}
```

Use "(" or "{0x28}" for a left parenthesis, "{0x7B}" for a left brace, "{0x7D}" for a right brace, or "{0x5C}" for a backslash.

### 8.7.6 MathJax limitations

MathJax limitations Limitations when using MathJax include:

Prog MathJax

⚠ \multicolumn, multirow

- MathJax does not support \multicolumn or multirow. These may be used in text tabulars or SVG math, but in MathJax math arrays they are emulated. \multicolumn only fills a single cell, resulting in a short row. \multirow simply prints its text on the first line.

⚠ footnotes

- Footnotes are emulated when used inside a MathJax expression. For an equation with a single footnote, the correct footnote number is used. For non-equations,

\footnotename is used instead, since the actual number cannot be tracked. See section 8.5.4 regarding the use of footnotes with MathJax.

⚠ references

- Inside a MathJax expression, references to equations work within the same HTML web page, but do not work when referring to an equation in a different HTML web page. Outside of a MathJax expression, in the text body, references work as expected.

lateximage

- Math appearing inside a lateximage, and therefore also inside a Ti*k*z or picture environment, is rendered as SVG math even if MathJax is used in the rest of the document.

siunitx

- For siunitx, see siunitx package, section 8.7.12.

physics

- For physics, see physics package, section 8.7.14.

tabbing

- A tabbing environment is emulated using an HTML <pre>. While MathJax is enabled inside tabbing, the browser may not correctly render the horizontal alignment of the math and text following after on the same line.

\text

- MathJax includes the *textmacros* extension, which supports various macros which are commonly used inside \text, such as \textbf and text accents. Lwarp supports this extension.

⚠ other macros and packages

- Many other math-related macros and packages are not directly supported by MathJax, including \ensuremath and occasionally-used macros such as \relax. While using MathJax, lwarp provides emulation for many of these macros, as well as for footnotes and emulation for dozens of packages (see table 2). In many cases these emulations simply ignore the package in a source-compatible way. Others produce a result which represents the meaning, even if they don't look exact. Look up each package in this document for a description of the limitations of each.

### 8.7.7 Catcode changes

preamble macros with math

The math shift character $ is not set for HTML output until after the preamble. Macros defined in the preamble which contain $ must be enclosed between \StartDefiningMath and \StopDefiningMath to temporarily change to the HTML meaning of $:

```
\StartDefiningMath
\newcommand{. . .}
\StopDefiningMath
```

As an alternative, use \( and \) instead of $, in which case \StartDefiningMath and \StopDefiningMath are not necessary.

If a package defines macros using $, it may be nessary to use \StartDefiningMath and \StopDefiningMath before and after loading the package.

### 8.7.8 Complicated inline math objects

\inlinemathnormal
\inlinemathother

changing contents

An inline math expression is usually converted to a reusable hashed SVG math image, or a MathJax expression. The hash or expression depends on the contents of the math expression. In most cases this math expression is static, such as $x+1$, so the image can be reused for multiples instances of the same expression. In some cases, the math

complicated alt tag
MathJax limitations

expression includes a counter or other object which may change between uses. Another problem is complicated contents which do not expand well in an alt tag. Yet another problem is math packages which are only partially emulated in MathJax. The macro \inlinemathother may be used before a sequence of dynamic or complicated math expressions, and \inlinemathnormal after. Doing so tells lwarp to use unhashed SVG math images for those particular expressins, even if MathJax is otherwise in use. See section 44.

### 8.7.9 Complicated display math objects

\displaymathnormal

By default, or when selecting \displaymathnormal, MathJax math display environments print their contents as text into HTML for MathJax to interpret, and SVG display math environments render their contents as SVG images and use their contents as the alt tag of HTML output. To do so, the contents are loaded into a macro for reuse. In some cases, such as complicated Ti*k*z pictures, compilation will fail.

\displaymathother
MathJax unsupported
complicated alt tag

When selecting \displaymathother, it is assumed that the contents are more complicated than "pure" math. An example is an elaborate Ti*k*z picture, which will not render in MathJax and will not make sense as an HTML alt tag. In this mode, MathJax is turned off, math display environments become SVG images, even if MathJax is selected, and the HTML alt tags become simple messages. The contents are internally processed as an environment instead of a macro argument, so complicated objects such as Ti*k*z pictures are more likely to compile successfully.

### 8.7.10 ntheorem package

Pkg ntheorem

⚠ Font control

This conversion is not total. Font control is via CSS, and the custom LaTeX font settings are ignored.

⚠ cref reference format undefined

If the print version does not use cleveref, place all \theoremstyle and \newtheorem declarations in the preamble inside \AtBeginDocument.[15] For some theorems, it may also be required to add inside \AtBeginDocument something such as:

```
\AtBeginDocument{ % if not using cleveref package
  \theoremstyle{definition}
  \newtheorem{dtheorem}{Definition}
  . . .
  \usepackage{etoolbox} % for \ifdef
  \ifdef{\cref}{
    \crefname{Proof}{Proof}{Proofs}
  }{}
}
```

⚠ Equation numbering

ntheorem has a bug with equation numbering in $\mathcal{AMS}$ environments when the option thref is used. lwarp does not share this bug, so equations with \split, etc, are numbered correctly with lwarp's HTML output, but not with the print output. It is recommended to use cleveref instead of ntheorem's thref option.

[15] lwarp uses cleveref for the HTML conversion, and loads cleveref \AtEndPreamble, just before \AtBeginDocument.

### 8.7.11 mathtools package

Pkg mathtools

⚠ equation numbering

`showonlyrefs` is disabled, as it conflicts with cleveref, which is used by lwarp. Equation numbers may not match the print version.

⚠ italic correction

`mathic` is not emulated for HTML.

⚠ MathJax

If using MathJax:

- mathtools `disallowspaces` does not work for MathJax. Protect brackets which are not optional arguments, such as:

```
\begin{gathered}{}
[p]=1 . . .
\end{gathered}
```

- `showonlyrefs` does not work in MathJax, and will result in a difference in equation numbering compared to the print version.
- Due to MathJax limitations, the following do not render well: `\overbracket`, `\underbracket`, `\overbrace`, `\underbrace`, `rcases`, `drcases`, `\Aboxed`, and `\ArrowBetweenLines`.
- For the new `cases`-like environments, `\text` must be used to set the normal roman font if desired.
- `alignat` in MathJax requires math mode, but in LaTeX it doesn't. It may be required to use `warpHTML` and `warpprint` to isolate a version for each mode.
- `\DeclarePairedDelimiter` and related must be in the preamble before `\begin{document}`.

### 8.7.12 siunitx package

Pkg siunitx

fractions

Due to *pdftotext* limitations, fraction output is replaced by symbol output for `per-mode` and `quotient-mode`.

⚠ math mode required

Some units will require that the expression be placed inside math mode.

⚠ tabular

Tabular `S` columns are rendered as simple `c` columns, and tabular `s` columns are not supported. These may be replaced by `c` columns with each cell contained in `\num` or `\si`.

⚠ MathJax

For math mode with SVG display, the original siunitx code is used while generating the SVG image. For text mode, lwarp uses an emulation which provides a very effective HTML interpretation of siunitx. For math expressions while using MathJax, a limited emulation is used. Most functions work reasonably well, but many options cannot be emulated. Complicated parsing such as for `\ang` is not supported. The result usually looks fine, and otherwise is enough to get the meaning across.

Document modifications required for MathJax:

custom units

- Custom units may be added with `\CustomizeMathJax`. See the lwarp-siunitx code for examples.

⚠ unit spacing

- Units work better using ~ between units instead of using periods.

⚠ \square, \cubic

- To square or cube compound units, enclose the following compound units in braces:

```
\cubic{\centi\meter}
```

  Single units do not require braces.

Also see MathJax option, section 8.7.4.

### 8.7.13 units and nicefrac packages

Pkg units
Pkg nicefrac

units and nicefrac work with lwarp, but MathJax does not have an extension for units or nicefrac. These packages do work with lwarp's option svgmath.

### 8.7.14 physics package

Pkg physics

physics works as-is for HTML with SVG math.

For MathJax, the MathJax v3 physics extension is used.

## 8.8 Graphics

Pkg graphics
Pkg graphicx
⚠ scale

Avoid using the \includegraphics scale option. Change:

```
\includegraphics[scale=<xx>]{ . . . }
```

to:

```
\includegraphics[width=<yy>\linewidth]{ . . . }
```

\includegraphics file formats

For \includegraphics with .pdf or .eps files, the user must provide a .pdf or .eps image file for use in print mode, and also a .svg, .png, or .jpg version of the same image for use in HTML.

```
\includegraphics{filename} % print:.pdf/.eps HTML:.svg, etc.
```

For print output, lwarp will automatically choose the .pdf or .eps format if available, or some other format otherwise. For HTML, one of the other formats is used instead.

If a .pdf or .eps image is referred to with its file extension, the extension will be changed to .svg for HTML:

```
\includegraphics{filename.pdf} % uses .svg in html
\includegraphics{filename.eps} % uses .svg in html
```

Prog pdftocairo
PDF to SVG

To convert a PDF image to SVG, use the utility *pdftocairo*:

Enter ⇒ **pdftocairo -svg filename.pdf**

Prog lwarpmk pdftosvg

For a large number of images, use *lwarpmk*:

Enter ⇒ **`lwarpmk pdftosvg *.pdf`** **(or a list of filenames)**

Prog `lwarpmk epstopdf` For EPS images converted to PDF using the package epstopdf, use

Prog epstopdf
epstopdf package

Enter ⇒ **`lwarpmk pdftosvg *.PDF`**

to convert to SVG images.

DVI LaTeX When using DVI *latex*, it is necessary to convert EPS to PDF and then to SVG:

Enter ⇒ **`lwarpmk epstopdf *.eps`** **(or a list of filenames)**

Enter ⇒ **`lwarpmk pdftosvg *.pdf`** **(or a list of filenames)**

PNG and JPG For PNG or JPGwhile using *pdflatex*, *lualatex*, or *xelatex*, the same file may be used in both print or HTML versions, and may be used with a file extension, but will also be used without the file extension if it is the only file of its base name.

GIF GIF files may be used for HTML, but another format must also be provided for print output.

file extension priorities If a file extension is not used, for HTML the file extension priorities are: SVG, GIF, PNG, then JPG.

⚠ graphics vs. graphicx If using the older graphics syntax, use both optional arguments for `\includegraphics`. A single optional parameter is interpreted as the newer graphicx syntax. Note that viewports are not supported by lwarp — the entire image will be shown.

⚠ viewport

⚠ viewport units For `\includegraphics`, avoid `px` and `%` units for width and height, or enclose them inside `warpHTML` environments. For font-proportional image sizes, use `ex` or `em`. For fixed-sized images, use `cm`, `mm`, `in`, `pt`, or `pc`. Use the keys `width=.5\linewidth`, or similar for `\textwidth` or `\textheight` to give fixed-sized images proportional to a 6 by 9 inch text area. Do not use the `scale` option, since it is not well supported by HTML browsers.

options `\includegraphics` accepts `width` and `height`, `origin`, `rotate` and `scale`, plus new `class` and `alt` keys.

HTML class With HTML output, `\includegraphics` accepts an optional `class=xyz` keyval combination, and if this is given then the HTML output will include that class for the image. The class is ignored for print output.

HTML `alt` tags Likewise, the `\includegraphics` `alt` key adds an HTML `alt` tag to an image, and is ignored for print output. If not assigned, each image is given an `alt` tag according to `\ImageAltText`.

`\rotatebox` `\rotatebox` accepts the optional `origin` key.

⚠ browser support `\rotatebox`, `\scalebox`, and `\reflectbox` depend on modern browser support. The CSS3 standard declares that when an object is transformed the whitespace which they occupied is preserved, unlike LaTeX, so expect some ugly results for scaling and rotating.

### 8.8.1 tikz package

Pkg `tikz` If using display math with `tikzpicture` or `\tikz`, along with matrices with the & character,

⚠ displaymath and matrices the document must be modified as follows:

```
\usepackage{tikz}
\tikzset{every picture/.style={ampersand replacement=\&}}
```

and each instance of & in the tikz expression must be replaced with \&.

### 8.8.2 grffile package

Pkg grffile

⚠ matching PDF and SVG

grffile is supported as-is. File types known to the browser are displayed, and unknown file types are given a link. Each PDF image for print mode should be accompanied by an SVG, PNG, or JPG version for HTML.

### 8.8.3 color package

Pkg color

color is superceded by xcolor, and lwarp requires several of the features of xcolor. When color is requested, xcolor is loaded as well.

### 8.8.4 xcolor package

Pkg xcolor

\colorboxBlock and \fcolorboxBlock

\colorboxBlock and \fcolorboxBlock are provided for increased HTML compatibility, and they are identical to \colorbox and \fcolorbox in print mode. In HTML mode they place their contents into a  instead of a . These s are set to display: inline-block so adjacent \colorboxBlocks appear side-by-side in HTML, although text is placed before or after each.

Print-mode definitions for \colorboxBlock and \fcolorboxBlock are created by lwarp's core if xcolor is loaded.

background: none

\fcolorbox and \fcolorboxBlock allow a background color of none, in which case only the frame is drawn, which can be useful for HTML.

color support

Color definitions, models, and mixing are fully supported without any changes required.

colored tables

\rowcolors is supported, except that the optional argument is ignored so far.

colored text and boxes

\textcolor, \colorbox, and \fcolorbox are supported.

\color and \pagecolor

\color and \pagecolor are ignored. Use CSS or \textcolor where possible.

### 8.8.5 epstopdf package

Pkg epstopdf

⚠ convert to .svg

Images with an .eps extension will be converted to .pdf. The HTML output uses the .svg version, so use

Enter ⇒ **lwarpmk pdftosvg <listofPDFfiles>**

to generate .svg versions.

### 8.8.6 pstricks package

Pkg pstricks

⚠ use pspicture

All pstricks content should be contained inside a pspicture environment.

### 8.8.7 pdftricks package

Pkg pdftricks

⚠ convert image files

The pdftricks image files <jobname>-fig*.pdf must be converted to .svg, or else a missing file error will occur. The image files must also be converted again whenever they change. To convert the images:

Enter ⇒ **lwarpmk pdftosvg <jobname>-fig*.pdf**

### 8.8.8 psfrag package

Pkg psfrag

⚠ use psfrags

The psfrags environment is modified to use lateximage to encapsulate the image. Always use a psfrags environment to contain any local \psfrag macros and the associated \includegraphics or \epsfig calls. Outside of a psfrags environment, psfrags adjustments will not be seen by lwarp.

⚠ Tip: Use a mono-spaced font for the tags in the EPS file.

### 8.8.9 pstool package

Pkg pstool

⚠ path and filename

\graphicspath is ignored, and the file directory must be stated.

The filename must not have a file extension.

Use

Enter ⇒ **lwarpmk html**

followed by

Enter ⇒ **lwarpmk limages**

.

### 8.8.10 asymptote package

Pkg asymptote

To compile:

```
pdflatex project.tex
asy project-*.asy
pdflatex project.tex

lwarpmk print
asy project-*.asy
lwarpmk print1
lwarpmk print1

lwarpmk html
asy project_html-*.asy
lwarpmk html1
lwarpmk html1
lwarpmk limages
```

### 8.8.11 overpic package

Pkg overpic

⚠ scaling

The macros `\overpicfontsize` and `\overpicfontskip` are used during HTML generation. These are sent to `\fontsize` to adjust the font size for scaling differences between the print and HTML versions of the document. Renew these macros before using the `overpic` and `Overpic` environments.

### 8.8.12 Multimedia packages

Pkg multimedia

Pkg movie15

Pkg media9

The packages multimedia, movie15, and media9 are supported.

HTML5 <audio> and <video> objects are created for `.mp3` and `.mp4` files.

HTML5 <embed> objects are created for `http` and `ftp` links.

`\href` links are created for other media types. (Unfortunately, there is not much overlap between the file types supported for print output and the file types supported by HTML5.)

For media9, a multimedia object is inserted for each `addresource=`, as well as each `flashvars` `source=` and `src=`. This may result in duplicate objects.

Undesired objects may be nullified by placing them inside `\warpprintonly` or the `warpprint` environment.

Each HTML multimedia object includes the poster text, except for <embed> objects. For movie15, the `text` option is supported to specify the poster text.

The `width`, `height`, and `totalheight` options are supported. The HTML object is scaled according to the display width, correctly compensating for either tall or wide viewports.

Other options are ignored.

media9 \addmediapath is supported. It is assumed that the same path structure will exist for the HTML document.

HTML5 media controls are always specified for each <audio> and <video> object.

media9 slideshows are not supported.

\hyperlinkmovie, \movieref, and \mediabutton are not supported.

3D objects are not supported.

If using a YouTube™ video, use an "embedded" URL with .../embed/... instead of .../v/...

## 8.9 Tabbing

The tabbing environment works, except that SVG math and lateximages do not yet work inside the environment.

⚠ math in tabbing

If math is used inside tabbing, place tabbing inside a lateximage environment, which will render the entire environment as a single SVG image.

## 8.10 Tabular

### 8.10.1 tabular environment

Tabular mostly works as expected, but pay special attention to the following, especially if working with environments, macros inside tabulars, multirows, siunitx S columns, or the packages multirow, longtable, supertabular, or xtab.

**Defining macros and environments:**

⚠ Misplaced alignment tab character &

- When defining environments or macros which include tabular and instances of the & character, it may be necessary to make & active before the environment or macro is defined, then restore & to its default catcode after, using the following commands. These are are ignored in print mode.

```
\StartDefiningTabulars
<define macros or environments using tabular and & here>
\StopDefiningTabulars
```

⚠ floatrow

This includes before and after defining any macro which used \ttabbox from floatrow.

⚠ tabular inside another environment

- When creating a new environment which contains a tabular environment, lwarp's emulation of the tabular does not automatically resume when the containing enviroment ends, resulting in corrupted HTML rows. To fix this, use \ResumeTabular as follows. This is ignored in print mode.

```
\StartDefiningTabulars %   (& is used in a definition)
\newenvironment{outerenvironment}
{
  \tabular{cc}
  left & right \\
}
{
  \TabularMacro\ResumeTabular
  left & right \\
  \endtabular
}
\StopDefiningTabulars
```

For developers:

- To automate the use of \StartDefiningTabulars and \EndDefiningTabulars, these macros may be embedded inside an HTML environment definition to automatically change the catcode of & before absorbing the arguments. Another environment may be embedded as well.

```
% Does the work after the catcode has been changed:
\newcommand*{\LWR@HTML@subsomename}[2]{%
  . . .
  \otherenvironmentname [<args>] {<args>}  % for example
}
% Change catcode before absorbing arguments:
\newcommand*{\LWR@HTML@somename{%
  \StartDefiningTabulars
  \LWR@HTML@subsomename
}
% Change catcode again at the end:
\newcommand*{\LWR@HTML@endsomename}{%
  . . .
  \endotherenvironmentname   % for example
  \StopDefiningTabulars
}
% Combine with the existing print definition:
\LWR@formattedenv{somename}
```

**Cell contents:**

⚠ macro in a table

- Using a custom macro inside a tabular data cell may result in an extra HTML data cell tag, corrupting the HTML table. To avoid this, use \TabularMacro just before the macro. This is ignored in print mode.

```
\TabularMacro\somemacro & more row contents \\
```

**Column specifiers:**

@ and !

- Only one each of @ and ! is used at each column, and they are used in that order.

\multirow

- In \multirow cells, the print version may have extra instances of <, >, @, and ! cells on the second and later rows in the \multirow which do not appear in the HTML version.

⚠ \newcolumntype

- \newcolumntype is ignored; unknown column types are set to l.

**Rules:**

- Doubled `\hlines`, `\midrules`, and vertical rules are supported.

vertical rules

- Vertical rules next to either side of an `@` or `!` column are displayed on both sides of the column.

width and trim

- Width options are honored. Trim options are converted to rounded top corners. Trim corners are not rounded with `@` or `!` columns, and full-width rules ignore trim. When given an optional width, each cell is styled to create the custom border. Without an optional width, the entire row is given a class to assign the standard border.

combined rules

- If you wish to use `\cmidrule` followed by `\bottomrule`, it may be necessary to use:

```
\cmidrule{2-3} \\[-2ex]
\bottomrule
```

The optional `-2ex` is ignored in HTML, but improves the visual formatting in the print output.

⚠ `\warpprintonly`
⚠ Misplaced `\noalign`

- For `\toprule` and `\bottomrule`, when combined with a `warpprint` or `warpHTML` environment, if a "Misplaced `\noalign`" error occurs, change

```
This & That \endhead
```

to

```
\warpprintonly{This & That \endhead}
```

and likewise with the other `\end` headings. Keep the `\endfirsthead` row unchanged, as it is still relevent to HTML output.

**Other:**

- tabularx ignores the width, but `X` columns do produce paragraph columns or multicolumns.

`longtable` headings

- For longtable, place headings and footings which do not apply to HTML inside `\warpprintonly{}`.

⚠ S columns

- For S columns (from the siunitx package), while producing print output, anything non-numeric must be placed inside { } braces, including commands such as `\multirow`. While producing HTML output, though, anything placed inside braces is not seen by lwarp's tabular handling algorithm. To resolve this problem, make a copy of the row, with one version for print output, containing the extra braces, and another version for HTML output, without the extra braces, such as:

```
\warpprintonly{1 & 2 & {\multirow{2}{2cm}{Text}} & 3 \\}
\warpHTMLonly{1 & 2 & \multirow{2}{2cm}{Text} & 3 \\}
```

⚠ `tabular` inside a `<span>`

- In LaTeX, a `tabular` may be placed inside a `minipage`, but in HTML a `<table>` may not be inside a `<span>`. If this situation is detected, a warning is printed instructing the user to isolate the `<span>` using `\warpprintonly` or the `warpprint` environment.

### 8.10.2 multirow package

vposn

- Note that recent versions of multirow include a new optional vposn argument.

multirow cells

- For multirow, insert `\mrowcell` into any empty multi-row cells. This will be a null function for the print output, and is a placeholder for parsing the table for HTML output. An error is generated if this is missed.

```
. . . &   \multirow{2}{.5in}{text}   & . . .
. . . &   \mrowcell                  & . . .
```

colored cells

- The multirow documentation regarding colored cells recommends using a negative number of rows. This will not work with lwarp, so \warpprintonly and \warpHTMLonly must be used to make versions for print and HTML.

with \multicolumn

- See section 416.2 for \multicolumnrow.

⚠ \multicolumn & \multirow

lwarp does not support directly combining \multicolumn and \multirow. Use \multicolumnrow instead. To create a 2 column, 3 row cell:

```
\multicolumnrow{2}{c}[c]{3}[0]{1in}[0pt]{Text}
```

The two arguments for \multicolumn come first, followed by the five arguments for \multirow, many of which are optional, followed by the contents.

⚠ skipped cells

As per \multirow, skipped cells to the right of the \multicolumnrow statement are not included in the source code on the same line. On the following lines,

⚠ empty cells

\mcolrowcell must be used for each cell of each column and each row to be skipped. An error is generated if this is missed.

```
. . . &   \multicolumnrow{2}{c}[c]{3}[0]{1in}[0pt]{Text}   & . . .
. . . &   \mcolrowcell          &          \mcolrowcell     & . . .
. . . &   \mcolrowcell          &          \mcolrowcell     & . . .
```

⚠ MathJax

- MathJax does not support multirow, so it is emulated to only print its text on the first row. \multirow works as expected in text tabulars or SVG math.

### 8.10.3 longtable package

Pkg longtable

Use one of either \endhead or \endfirsthead for both print and HTML, and use a \warpprintonly macro to disable the other head phrase, and also the \endfoot and \endfirstfoot phrases. (See section 8.10.4 if using threeparttablex.)

```
\begin{longtable}{ [column specifiers] }
[ . . . ] \endfirsthead   % or \endhead, for print and HTML
\warpprintonly{          % not used in HTML
  [ . . . ] \endhead     % or \endfirsthead
  [ . . . ] \endfoot
  [ <lastfoot macros> ] \endlastfoot
}
. . .  table contents . . .
\warpHTMLonly{
  [ <lastfoot macros> ]   % HTML last footer, without \endfoot
                                                % or \endlastfoot.
}
\end{longtable}
```

⚠ Misplaced \noalign

Use the \warpprintonly macro instead of the warpprint environment. Doing so helps avoid "Misplaced \noalign." when using \begin{warpprint}.

⚠ \kill

\kill is ignored, place a \kill line inside

```
\begin{warpprint} . . .  \end{warpprint}
```

or place it inside \warpprintonly.

⚠ lateximage longtable is not supported inside a lateximage.

### 8.10.4 threeparttablex package

Pkg threeparttablex threeparttablex is used with longtable and booktabs as follows:

```
\begin{longtable}{ [column specifiers] }
[ . . . ] \endfirsthead   % or \endhead, for print and HTML
\warpprintonly{          % not used in HTML
  [ . . . ] \endhead     % or \endfirsthead
  [ . . . ] \endfoot
  \bottomrule \insertTableNotes \endlastfoot
}
. . .  table contents . . .
\warpHTMLonly{   % HTML last footer
  \bottomrule
  \UseMinipageWidths     % optional
  \insertTableNotes
  \endlastfoot
}
\end{longtable}
```

table width The table notes are created using a \multicolumn. By default the width is not specified to the browser, so long table notes can cause the table to be spread out horizontally. For HTML output, lwarp guesses the width of the table depending on the number of columns, then restricts its guess to a min/max range. To use this guess for the width of the table notes, use \UseMinipageWidths before \insertTableNotes. The width is then specified, and in many cases the result is an improvement in overall table layout.

### 8.10.5 supertabular and xtab packages

Pkg supertabular For \tablefirsthead, etc., enclose them as follows:

Pkg xtab

⚠ Misplaced alignment tab character &

```
\StartDefiningTabulars
\tablefirsthead
. . .
\StopDefiningTabulars
```

See section 8.10.1.

⚠ lateximage supertabular and xtab are not supported inside a lateximage.

### 8.10.6 colortbl package

Pkg colortbl Only use \rowcolor and \cellcolor at the start of a row, in that order.

⚠ row/cell color colortbl ignores the overhang arguments.

### 8.10.7 ctable package

⚠ Misplaced alignment tab character &

Use \StartDefiningTabulars before one or more \ctable s, and \StopDefiningTabulars after. These change the meaning of the ampersand & character.

### 8.10.8 bigdelim package

Pkg bigdelim

⚠ use \mrowcell

\ldelim and \rdelim use \multirow , so \mrowcell must be used in the proper number of empty cells in the same column below \ldelim or \rdelim , but not in cells which are above or below the delimiter:

```
\begin{tabular}{lll}
<empty> & a & b \\
\ldelim{\{}{3}{.25in}[left ] & c & d \\
\mrowcell & e & f \\
\mrowcell & g & h \\
<empty> & i & j \\
\end{tabular}
```

<-> a b

left { c d
e f
g h

<-> i j

For MathJax , limited emulation is provided which merely prints the delimter and optional text in the first row.

## 8.11 Floats

### 8.11.1 Float contents alignment

⚠ figure & table alignment

\centering , etc. are honored in a figure or table if they are the first command inside the float:

```
\begin{table*}
\centering
\caption{A Table}
. . .
```

### 8.11.2 float , trivfloat , and/or algorithmicx together

Pkg float

Pkg trivfloat

Pkg algorithmicx

⚠ package conflicts

If using \newfloat , trivfloat , and/or algorithmicx together, see section 616.1.

```
\ifxetexorluatex
\else
    \ifdefstring{\f@family}{cmr}{
        \IfFileExists{type1ec.sty}% found in cm-super
        {}

\boolfalse{usingOSWindows}
```

## 28.3 Unix, Linux, and Mac OS

\OSPathSymbol Symbol used to separate directories in a path.

```
\newcommand*{\OSPathSymbol}{/}
```

## 28.4 MS-Windows

For MS-Windows:

\LWR@setOSWindows Set defaults for the MS-Windows operating system. lwarp attempts to auto-detect the operatings system, and the OSWindows option may also be used to force MS-Windows compatibility.

```
\newcommand*{\LWR@setOSWindows}
{
\booltrue{usingOSWindows}
\renewcommand*{\OSPathSymbol}{\@backslashchar}
\def\LWRopquote{"}
\def\LWRopseq{\space\LWRamp\space\space}

```

# 29 Package options

Pkg kvoptions Allows key/value package options.

```
\RequirePackage{kvoptions}
\SetupKeyvalOptions{family=LWR,prefix=LWR@}
```

\lwarpsetup A user interface to set the keys:

```
\newcommand{\lwarpsetup}[1]{\setkeys{LWR}{#1}}
```

Bool warpingprint
Bool warpingHTML
Bool mathjax
Bool LWR@origmathjax

Set to true/false depending on the package option selections for print/HTML/EPUB output and mathsvg/mathjax.

LWR@origmathjax remembers the original setting to be restored by \displaymathnormal.

```
\newbool{warpingprint}
\newbool{warpingHTML}
\newbool{mathjax}
\newbool{LWR@origmathjax}
```

defaults The default is print output, and SVG math if the user chose HTML output.

```
\booltrue{warpingprint}%
\boolfalse{warpingHTML}%
\boolfalse{mathjax}%
```

Opt warpprint If the warpprint option is given, boolean warpingprint is true and boolean warpingHTML is false, and may be used for \ifbool tests.

```
\DeclareVoidOption{warpprint}{%
    \PackageInfo{lwarp}{Using option 'warpprint'}
    \booltrue{warpingprint}%
    \boolfalse{warpingHTML}%

```

Opt warpHTML Anything in the warpHTML environment will be generated for HTML output only.

Opt warpHTML If the warpHTML option is given, boolean warpingHTML is true and boolean warpingprint is false, and may be used for \ifbool tests.

```
\DeclareVoidOption{warpHTML}{%
    \PackageInfo{lwarp}{Using option 'warpHTML'}%
    \booltrue{warpingHTML}%
    \boolfalse{warpingprint}%

```
982 }
```

Opt BaseJobname
Default: \jobname

Option BaseJobname sets the \BaseJobname for this document.

This is the \jobname of the printed version, even if currently compiling the HTML version. I.e. this is the \jobname without _html appended. This is used to set \HomeHTMLFilename if the user did not provide one.

```
983 \DeclareStringOption[\jobname]{BaseJobname}
```

Opt ImagesDirectory
Default: \jobname-images

Option ImagesDirectory sets the name of the directory to use for the lateximage images.

```
984 \DeclareStringOption[\BaseJobname-images]{ImagesDirectory}
```

Opt ImagesName
Default: image-

Option ImagesName sets the prefix to use for the lateximage images.

```
985 \DeclareStringOption[image-]{ImagesName}
```

Opt makeindexStyle
Default: lwarp.ist

Selects a custom .ist file. A customized file should be based on lwarp.ist. See section 8.6.20.

```
986 \DeclareStringOption[lwarp.ist]{makeindexStyle}
```

Opt xindyStyle
Default: lwarp.xdy

Selects a custom .xdy file. A customized file should be based on lwarp.xdy. See section 8.6.21.

```
987 \DeclareStringOption[lwarp.xdy]{xindyStyle}
```

Opt xindyLanguage
Default: english

Sets the *xindy* language to be assigned in *lwarpmk*'s configuration files. This is then used by *lwarpmk* while processing the index and glossary.

```
988 \DeclareStringOption[english]{xindyLanguage}
```

Opt xindyCodepage
Default: utf8

Sets the *xindy* codepage to be assigned in *lwarpmk*'s configuration files. This is then used by *lwarpmk* while processing the index.

```
989 \DeclareStringOption[utf8]{xindyCodepage}
```

Opt xindexConfig
Default: <empty>

Selects a custom xindex-*.lua file. A customized file should be based on xindex-cfg.lua. See section 8.6.22.

```
990 \DeclareStringOption[]{xindexConfig}
```

Opt pdftotextEnc
Default: UTF-8

The option pdftotextEnc sets the encoding used by *pdftotext*. This is passed to *pdftotext* using its -enc option, and is used when converting LaTeX PDF output with HTML tags into a plain-text file with HTML tags.

```
991 \DeclareStringOption[UTF-8]{pdftotextEnc}
```

Opt lwarpmk

Tells lwarp to generate a local copy of *lwarpmk* called `lwarpmk.lua`. Useful for archiving for future use. This file may be made executable and acts just like *lwarpmk*.

If `lwarpmk` option, creates a local copy of `lwarpmk.lua`:

```
\newbool{LWR@creatinglwarpmk}
\boolfalse{LWR@creatinglwarpmk}

\DeclareVoidOption{lwarpmk}{
    \PackageInfo{lwarp}{Using option 'lwarpmk'}
    \booltrue{LWR@creatinglwarpmk}
}
```

Opt OSWindows

Tells lwarp to use MS-Windows compatibility. Auto-detection of the operating system is attempted, and this option is only necessary if the auto-detection fails. See the automatically-generated `lwarpmk.conf` file to find out whether the operating system was detected correctly.

```
\DeclareVoidOption{OSWindows}{
    \PackageInfo{lwarp}{Using option 'OSWindows'}
    \LWR@setOSWindows
}
```

Opt HomeHTMLFilename
Default: \BaseJobname

The filename of the homepage. The default is the jobname. This option is stored into `\LWR@HomeHTMLFilename`, and later transferred into `\HomeHTMLFilename` for internal use.

```
\DeclareStringOption[]{HomeHTMLFilename}
```

Opt HTMLFilename
Default: <empty>

The filename prefix of web pages after the homepage. The default is empty, no prefix. This option is stored into `\LWR@HTMLFilename`, and later transferred into `\HTMLFilename` for internal use.

```
\DeclareStringOption[]{HTMLFilename}
```

Opt PrintLatexCmd
Default: <automatic>

The shell commands to use to compile the print document.

```
\DeclareStringOption[]{PrintLatexCmd}
```

Opt HTMLLatexCmd
Default: <automatic>

The shell commands to use to compile the HTML document.

```
\DeclareStringOption[]{HTMLLatexCmd}
```

Opt PrintIndexCmd
Default: <empty>

The shell commands to use to compile the print indexes.

```
\DeclareStringOption[]{PrintIndexCmd}
```

Opt HTMLIndexCmd
Default: <empty>

The shell commands to use to compile the HTML indexes.

```
\DeclareStringOption[]{HTMLIndexCmd}
```

Opt LatexmkIndexCmd
Default: <empty>

The shell commands to by used by *latexmk* to compile the print indexes. Unlike

`PrintIndexCmd` and `HTMLIndexCmd`, `LatexmkIndexCmd` does not include the filename, which will be provided by *latexmk*.

```
\DeclareStringOption[]{LatexmkIndexCmd}
```

Opt `makeindex` Tells lwarp to use *makeindex* for index generation. When `lwarpmk.conf` and `*.lwarpmkconf` are generated, `PrintIndexCmd` and `HTMLIndexCmd` will be set for *makeindex* with a single index file.

```
\DeclareBoolOption[false]{makeindex}
```

Opt `xindy` Tells lwarp to use *xindy* for index generation. When `lwarpmk.conf` and `*.lwarpmkconf` are generated, `PrintIndexCmd` and `HTMLIndexCmd` will be set for *xindy* with a single index file.

```
\DeclareBoolOption[false]{xindy}
```

Opt `xindex` Tells lwarp to use *xindex* for index generation. When `lwarpmk.conf` and `*.lwarpmkconf` are generated, `PrintIndexCmd` and `HTMLIndexCmd` will be set for *xindex* with a single index file.

```
\DeclareBoolOption[false]{xindex}
```

Opt `IndexRef` Tells lwarp how to display the index entries in HTMLoutput. See section 7.5.
Default: `cref`

```
\DeclareStringOption[cref]{IndexRef}
```

Opt `GlossaryCmd` The shell command to use to compile the glossary. The print or HTML version of the glossary filename will be appended to this command.
Default: `makeglossaries`

```
\DeclareStringOption[makeglossaries]{GlossaryCmd}
```

Opt `latexmk` Option `latexmk` tells *lwarpmk* to use *latexmk* when compiling documents.

```
\DeclareBoolOption[false]{latexmk}
```

Opt `dvips` Option `dvips` tells *lwarpmk* to use *dvips* when compiling DVI *latex* documents.

```
\DeclareBoolOption[false]{dvips}
```

Opt `dvipdfm` Option `dvipdfm` tells *lwarpmk* to use *dvipdfm* when compiling DVI *latex* documents.

```
\DeclareBoolOption[false]{dvipdfm}
```

Opt `dvipdfmx` Option `dvipdfmx` tells *lwarpmk* to use *dvipdfmx* when compiling DVI *latex* documents.

```
\DeclareBoolOption[false]{dvipdfmx}
```

# 30 Required packages

These packages are automatically loaded by lwarp when generating HTML output. Some of them are also automatically loaded when generating print output, but some are not.

**for HTML output:**

```
1186 \begin{warpHTML}
```

Pkg fontspec Load fontspec if necessary:

```
1187 \ifxetexorluatex
1188
```

```
\microtypesetup{
    protrusion=false,
    expansion=false,
    tracking=false,
    kerning=false,
    spacing=false}
%    \begin{macrocode}
%
% Disable ligatures for typewriter fonts.
% The comma was causing issues with \brand{MathJax} and \cs{,} followed by a comma.
% Ligatures for f, q, t, etc used to be disabled for non-typewriter fonts, but
% are now allowed.
% \changes{v0.89}{2020/08/01}{Disable typewriter ligatures.}
% ^^A \DisableLigatures[{,},f,q,t,T,Q]{encoding = *,family = *}% previous
%    \begin{macrocode}
\DisableLigatures{encoding = *,family = tt*}

\fi

\end{warpHTML}
```

Pkg geometry Tactics to avoid unwanted page breaks and margin overflow:

- Uses a very long and wide page to minimize page breaks and margin overflow.
- Uses a scriptsize font.
- Uses extra space at the margin to avoid HTML tag overflow off the page.
- Forces a new PDF page before some environments.
- Forces line break between major pieces of long tags.

**for HTML output:**

```
\begin{warpHTML}
```

If geometry has not yet been loaded, use the preexising page and text sizes to be preserved for later reuse. These will be replaced by lwarp `\AtBeginDocument` with a very large page size to reduce HTML tag overflow off the page.

```

Used to write helper files while creating the print version.

Recent versions of LaTeX (as of Fall 2019) now include the functionality of the filecontents package, but with a new optional argument used to specify whether to force the overwriting of an existing file. If an older LaTeX kernel is used, the original filecontents package is used, but it is patched to throw away the new optional argument.

```

`\LWR@lookforpackagename` `{⟨index⟩}`

If HTML, and if this is an lwarp-supported package name, re-direct it to the lwarp version by renaming it `lwarp-` followed by the original name.

Looks `index` deep into the list of package names, `\LWR@requirepackagenames`, and builds `\LWR@parsedrequirepackagenames` which is the modified list of names.

```
\newcommand*{\LWR@lookforpackagename}[1]{%

Find the `index`'th package name from the list:

```

If using catoptions, an error occurs if a package is loaded with an option then loaded again with no options. lwarp does this if a package is preloaded then later patched. To avoid an error while using catoptions, if a package has already been loaded, it is loaded again with its original options.

# 35 Debugging messages

HTML comments

To have the HTML output include additional HTML comments, such as which  is closing, use

```
\booltrue{HTMLDebugComments}
```

To have debug information 500(62sTJ/33(it)-500(tht)-5losing,)-250(use)]TJ0.7gq0.7[30702250(debugging)-25

```
\begin{warpHTML}
\newenvironment{LWR@HTML@name}{...}% may also use xparse

\LWR@formattedenv{name}
\end{warpHTML}
```

**If the original used** xparse**:** A copy must be made using a new name:

```
\begin{warpHTML}
\NewDocumentCommand{\LWR@print@name}{..}{..}% copy the original

\NewDocumentCommand{\LWR@HTML@name}{..}{..}% or use \newcommand

\LWR@formatted{name}
\end{warpHTML}
```

Similar for an environment, using `\LWR@formattedenv`. (`\LWR@formatted` and `\LWR@formattedenv` use `\LetLtxMacro` to copy the original print definiton, which may not work with macros and environments created by xparse, so the print version must be manually recreated in the lwarp source.)

**For a new macro or environment, not using** xparse **for the print version:**

```
\begin{warpall}
\newcommand{\name}{...}% NOT xparse!
\end{warpall}

\begin{warpHTML}
\newcommand{\LWR@HTML@name}{...}% may use xparse for HTML

\LWR@formatted{name}
\end{warpHTML}
```

Similar for an environment. The plain `\name` or environment `name` is used for the printed version, and is placed inside `warpall`. xparse may be used for the `\LWR@HTML@<name>` version. expl3 syntax may be used for the print and HTML versions.

**For a new macro or environment, using** xparse**:** It is possible to use xparse for an entirely new macro or environment by defining the `\LWR@print@<name>` version with xparse, along with `\name` defined without xparse to refer directly to the `\LWR@print` version:

**for HTML output:**

```
\begin{warpHTML}
```

`\LWR@formatting` Remembers if selected print/HTML formatting.

These booleans modify the HTML output in various ways to improve conversion to EPUB or word processor imports.

**for HTML & PRINT:**

```
\begin{warpall}
```

## 37.1 User-level controls

Bool `FormatEPUB`

Changes HTML output for easy EPUB conversion via an external program. Removes per-file headers, footers, and nav. Adds footnotes per chapter/section.

```
\newbool{FormatEPUB}
\boolfalse{FormatEPUB}

Bool `FormatWP`
Default: `false`

Changes HTML output for easier conversion by a word processor. Removes headers and nav, prints footnotes per section, and also forces single-file output and turns off HTML debug comments.

```
\newbool{FormatWP}
\boolfalse{FormatWP}

Bool `WPMarkFloats`
Default: `false`

Adds

```
=== begin table ===
. . .
=== end ===
```

or

```
=== begin figure ===
. . .
=== end ===
```

around floats while formatting for word processors. This helps identify boundaries of floats to be manually converted to word-processor frames and captions. [18]

```
\newbool{WPMarkFloats}
\boolfalse{WPMarkFloats}

Bool `WPMarkMinipages` Default: `false`

Adds

```
=== begin minipage ===
. . .
=== end minipage ===
```

around minipages while formatting for word processors. This helps identify boundaries of minipages to be manually converted to word-processor frames.

```
\newbool{WPMarkMinipages}
\boolfalse{WPMarkMinipages}
```

Bool `WPMarkTOC` Default: `true`

While formatting for word processors, adds

```
=== table of contents ===
```

where the Table of Contents would have been. This helps identify where to insert the actual TOC.

*If set* `false`*, the actual* TOC *is printed instead.*

```
\newbool{WPMarkTOC}
\booltrue{WPMarkTOC}
```

Bool `WPMarkLOFT` Default: `false`

While formatting for word processors, adds

```
=== list of figures ===    and/or
=== list of tables ===
```

where each of these lists would have been. This helps identify where to insert the actual lists.

*If set* `false`*, the actual lists are printed instead.*

```
\newbool{WPMarkLOFT}
\boolfalse{WPMarkLOFT}
```

Bool `WPMarkMath` Default: `false`

While formatting for word processors, prints math as LaTeX code instead of creating SVG images or MathJax. This is useful for cut/paste into the ***LibreOffice Writer TeXMaths*** extension.

```
\newbool{WPMarkMath}
\boolfalse{WPMarkMath}
```

Bool `WPTitleHeading` Default: `false`

While formatting for word processors, `true` sets the document title to `<h1>`, which is expected for HTML documents, but also causes the lower-level section headings to start at

[18] Perhaps some day word processors will have HTML import options for identifying `<figure>` and caption tags for figures and tables.

Heading 2 when imported into LibreOffice. Set to `false` to cause the title to be plain text, and the section headings to begin at Heading 1.

See table 10 on page 184.

```
\newbool{WPTitleHeading}
\boolfalse{WPTitleHeading}

\end{warpall}
```

## 37.2 Heading adjustments

If formatting the HTML for a word processor, adjust heading levels.

If `WPTitleHeading` is true, adjust so that `part` is Heading 1.

If `WPTitleHeading` is false, use <h1> for the title, and set `part` to Heading 2.

# 38 Remembering original formatting macros

Remember original definitions of formatting commands. Will be changed to HTML commands for most uses. Will be temporarily restored to original meaning inside any lateximage environment. Also nullify unused commands.

Some packages redefine \#, which is used to generate HTML, so the original must be remembered here.

# 39 Accents

Native LaTeX accents such as \" will work, but many more kinds of accents are available when using Unicode-aware XeLaTeX and LuaLaTeX. If using accents in section names which will become file names, it is recommended to use the LaTeX accents such as \" and \v instead of Unicode accents. The LaTeX accents will have the accents stripped when creating the filenames, whereas the Unicode accents will appear in the file names, which may cause issues with some operating systems.

**for HTML output:**

```
\begin{warpHTML}
```

Without `\AtBeginDocument`, `\t` was being re-defined somewhere.

```
\AtBeginDocument{
```

The following are restored for print when inside a `lateximage`.

For Unicode engines, only `\t` needs to be redefined:

```
\LetLtxMacro\LWR@origtie\t
```

For pdfLaTeX, additional work is required:

```
\ifPDFTeX% pdflatex or dvi latex
\LetLtxMacro\LWR@origgraveaccent\‘
\LetLtxMacro\LWR@origacuteaccent\’
\LetLtxMacro\LWR@origcircumflexaccent\^
\LetLtxMacro\LWR@origtildeaccent\~
\LetLtxMacro\LWR@origmacronaccent\=
\LetLtxMacro\LWR@origbreve\u
```

```
\LetLtxMacro\LWR@origdotaccent\.
\LetLtxMacro\LWR@origdiaeresisaccent\"
\LetLtxMacro\LWR@origdoubleacuteaccent\H
\LetLtxMacro\LWR@origcaronaccent\v
\LetLtxMacro\LWR@origdotbelowaccent\d
\LetLtxMacro\LWR@origcedillaaccent\c
\LetLtxMacro\LWR@origmacronbelowaccent\b
```

The HTML redefinitions follow.

For pdfLaTeX, Unicode diacritical marks are used:

```
\renewcommand*{\‘}[1]{#1\HTMLunicode{0300}}
\renewcommand*{\’}[1]{#1\HTMLunicode{0301}}
\renewcommand*{\^}[1]{#1\HTMLunicode{0302}}
\renewcommand*{\~}[1]{#1\HTMLunicode{0303}}
\renewcommand*{\=}[1]{#1\HTMLunicode{0304}}
\renewcommand*{\u}[1]{#1\HTMLunicode{0306}}
\renewcommand*{\.}[1]{#1\HTMLunicode{0307}}
\renewcommand*{\"}[1]{#1\HTMLunicode{0308}}
\renewcommand*{\H}[1]{#1\HTMLunicode{030B}}
\renewcommand*{\v}[1]{#1\HTMLunicode{030C}}
\renewcommand*{\d}[1]{#1\HTMLunicode{0323}}
\renewcommand*{\c}[1]{#1\HTMLunicode{0327}}
\renewcommand*{\b}[1]{#1\HTMLunicode{0331}}
\fi
```

For all engines, a Unicode diacritical tie is used:

```
\def\LWR@t#1#2{#1\HTMLunicode{0361}#2}
\renewcommand*{\t}[1]{\LWR@t#1}
```

`\LWR@restoreorigaccents` Called from `\restoreoriginalformatting` when a `latexmage` is begun.

```
\ifPDFTeX% pdflatex or dvi latex
\newcommand*{\LWR@restoreorigaccents}{%

# 40 Configuration files

## 40.1 Decide whether to generate configuration files

Configuration files are only written if processing the print version of the document, and not processing a pstool image. pstool uses an additional compile for each image using the original document's preamble, which includes lwarp, so the lwarp configuration files are turned off if `-pstool` is part of the `\jobname`.

Default to no configuration files:

```
\LWR@excludecomment{LWRwriteconf}{writeconf}
```

Generate configuration files if print mode and not `-pstool`:

**for PRINT output:**

```
\begin{warpprint}
\fullexpandarg%
\IfSubStr*{\jobname}{-pstool}
    {
        \PackageInfo{lwarp}{%
            Jobname with -pstool is found.\MessageBreak
            Not generating lwarp configuration files,%
        }
    }
    {
        \PackageInfo{lwarp}{Generating lwarp configuration files,}%
        \LWR@includecomment{LWRwriteconf}{writeconf}
    }
\end{warpprint}
```

## 40.2 <project>_html.tex

File `*_html.tex` Used to allow an HTML version of the document to exist alongside the print version.

**Config file:**

```
\begin{LWRwriteconf}
\immediate\openout\LWR@quickfile=\jobname_html.tex
\immediate\write\LWR@quickfile{%
\detokenize{\PassOptionsToPackage}%
{warpHTML,BaseJobname=\jobname}{lwarp}%
}
\immediate\write\LWR@quickfile{%
\detokenize{\input}\string{\jobname.tex\string }%
}
\immediate\closeout\LWR@quickfile
\end{LWRwriteconf}
```

## 40.3 *lwarpmk* configuration files

**Config file:** 1938 `\begin{LWRwriteconf}`

`\LWR@lwarpconfversion` The version number of the configuration file, allowing *lwarpmk* to detect an obsolete configuration file format. Incremented by one each time the configuration file format changes. (This is NOT the same as the lwarp version number.)

1939 `\newcommand*{\LWR@lwarpconfversion}{2}% also in lwarpmk.lua`

## 40.10 lwarp_one_limage.cmd

File lwarp_one_limage.cmd

Used by lwarp to help make lateximages when using Windows.

This must be present when compiling the project, but does not need to be present when distributing the resulting HTML files.

The arguments are each of the three fields from <project>-images.txt, and also the base name of the source file.

*MiKTeX* does not allow file lwarp_one_limage.cmd to be created directly by *lwarpmk*, so lwarp_one_limage.txt is created instead, then copied to lwarp_one_limage.cmd by *lwarpmk*. This occurs each time *lwarpmk* used to create lateximages.

**Config file:**
```
\begin{LWRwriteconf}
\immediate\openout\LWR@quickfile=lwarp_one_limage.txt
\immediate\write\LWR@quickfile{%
    pdfseparate -f \LWRpercent 1 -l \LWRpercent 1 \LWRpercent 4_html.pdf %

## 40.11 lwarp_mathjax.txt

(*Emulates or patches code by* Davide P. Cervone.)

File lwarp_mathjax.txt

The default MathJax script used by lwarp when using MathJax. A recent version of MathJax is used, as served by the recommended repository. Adjustments are made to allow LaTeX to control the equation tags and provide for starred macros.

\MathJaxFilename determines which script file is copied into the HTML pages, and defaults to lwarp_mathjax.txt. The script files must be present when compiling the project, but do not need to be present when distributing the resulting HTML files.

custom script

To generate a custom script, such as to use a local repository, copy lwarp_mathjax.txt to a new file, make changes while keeping lwarp's adjustments for equation numbering and starred macros, and use \MathJaxFilename to select the new filename.

**Config file:**

// Modified by Brian Dunn to adjust equation numbering and add subequations.
//
// LaTeX can use \seteqnumber{subequations?}{section}{number} before each equation.

## 40.12 `lwarpmk.lua` — `lwarpmk` option

Opt `lwarpmk` Creates a local copy of *lwarpmk*.

Prog `lwarpmk` Command-line utility to process lwarp files and images.

parallel processing `latexi`mages and SVG math images are generated using multiple processes in parallel. For Unix and Linux, every 32 images the `wait` command is issued to wait for the previous batch of images to finish processing before starting a new batch. For Windows, every 32 images one task is dispatched with

```
START /B /WAIT /BELOWNORMAL
```

which causes the operating system to wait until this lesser-priority tasks finishes, hopefully also waiting for the normal priority tasks which were already in progress to also complete. Afterwards, the next batch of images is started.

The following is only generated if the `lwarpmk` option was given to lwarp.

```

A stack to record the action to take to close each nesting level: Add more levels of stack if necessary for a very deeply nested document, adding to `\pushclose` and `\popclose` as well.

```
\newcommand*{\LWR@closeone}{}% top of the stack
\newcommand*{\LWR@closetwo}{}

## 41.3 Closing depths

A stack to record the depth of each level:

Note that nested LaTeX structures may push depths which are non-sequential.

*Ex:*

```
\begin{itemize}
   \item{A}
   \begin{description}
      \item{B}

# 42 Data arrays

These macros are similar to the arrayjobx package, except that `\LWR@setexparray`'s argument is expanded only once when assigned.

`name` has no backslash, `index` can be a number or a text name, and an empty `value` must be `\relax` instead of empty.

To assign an empty value:

```
\LWR@setexparray{name}{index}{}
```

**for HTML output:**

```
\begin{warpHTML}
```

`\LWR@setexparray` {⟨*name*⟩} {⟨*index*⟩} {⟨*contents*⟩}

# 44 Localizing dynamic math

Inline SVG math usually uses a hash of its contents to generate `latex`images which are reusable for multiple instances with the same contents. If the contents may change for each use, such as depending on the current value of a counter, then `\inlinemathother` must be used before the inline math expression, and `\inlinemathnormal` must be used after.

For MathJax, the inline math expression is usually printed for MathJax to interpret. When marked as dynamic math, the following inline math expression will be displayed as an unhashed inline SVG image instead.

For existing code and packages, it may be possible to patch macros after they have been defined, using the xpatch package, which is pre-loaded by lwarp:

```
\xpatchcmd{\macroname}
    {$math expression$}
    {\inlinemathother$math expression$\inlinemathnormal}
    {}
    {\typeout{Error patching macroname.}}
```

**for HTML & PRINT:**

```
\begin{warpall}
```

Bool `LWR@dynamicmath` Default: `false`

True to mark inline math which is dynamic in nature, thus should not be hashed for reuse.

```
\newbool{LWR@dynamicmath}
\boolfalse{LWR@dynamicmath}
```

`\inlinemathother`

Place before using $ … $ or \( … \) if the contents of the math are not static, depending on counters or dynamic macros.

```
\newcommand{\inlinemathother}{%
\LWR@traceinfo{inlinemathother}%

`\inlinemathnormal`

# 45 HTML entities

```

\HTMLFilename The prefix for all generated HTML files other than the home page, defaulting to empty. See section 7.6.1.

```
\providecommand*{\HTMLFilename}{}
```

\HomeHTMLFilename The filename of the home page, defaulting to the \BaseJobname. See section 7.6.1.

```
\providecommand*{\HomeHTMLFilename}{\BaseJobname}
```

\SetHTMLFileNumber {⟨*number*⟩}

Sets the file number for the next file to be generated. 0 is the home page. Use just before the next sectioning command, and set it to one less than the desired number of the next section. May be used to generate numbered groups of nodes such as 100+ for one chapter, 200+ for another chapter, etc.

```
\newcommand*{\SetHTMLFileNumber}[1]{%
    \setcounter{LWR@htmlfilenumber}{#1}%

Bool FileSectionNames Selects how to create HTML file names.

Defaults to use section names in the filenames.

```

```
\newcounter{LWR@HTMLpagenum}

```

Ctr LWR@htmlseqfilenumber A sequential count of the number of each HTML file as it is being created. Number 0 is the home page. Unlike \LWR@htmlfilenumber, this one is known to increment by one for each file. This is used to generate previous /next links for each web page, via labels called \BaseJobname-autofile-*, and the last page is also labelled \BaseJobname-autofile-last.

```
\newcounter{LWR@htmlseqfilenumber}
\setcounter{LWR@htmlseqfilenumber}{0}
```

Bool LWR@setseqfilelabel At each new HTML file, this is false until a sectional unit is used, at which point this is set true and a label is placed. In this way, the previous/next labels will point to a named section.

```
\newbool{LWR@setseqfilelabel}
\setbool{LWR@setseqfilelabel}{false}
```

Ctr LWR@htmlfilenumber

Records the number of each HTML file as it is being created. Number 0 is the home page. This might not be sequential, as the user may use \SetHTMLFileNumber to create groups of numbered nodes.

```
\newcounter{LWR@htmlfilenumber}
\setcounter{LWR@htmlfilenumber}{0}
```

For a LaTeX section named “Index” or “index” without a prefix, create a filename with a trailing -0 to avoid colliding with the HTML filename index.html:

```
{%
    \LWR@traceinfo{LWR@htmlsectionfilename C \LWR@sanitized}%
    \ifboolexpr{
            test{\ifdefvoid{\HTMLFilename}} and
            (
                test{\ifdefstring{\LWR@sanitized}{Index}} or
                test{\ifdefstring{\LWR@sanitized}{index}}
            )
    }%
    {%
        \LWR@traceinfo{Adding a zero to the index filename.}%
        \LWR@sanitized-0.html%
    }%
```

Otherwise, create a filename with the chosen prefix:

```
    {%
        \HTMLFilename\LWR@isolate{\LWR@sanitized}.html%
    }%
}%
\LWR@traceinfo{LWR@htmlsectionfilename Z}%

```

## 62.1 Sanitizing expressions for HTML

Math expressions are converted to lateximages, and some math environments may contain &, <, or >, which should not be allowed inside an HTML <alt> tag, so must convert them to HTML entities.

\LWR@replacestrings {⟨*search*⟩} {⟨*replace*⟩}

```
\newbool{LWR@MathJax@silentquotes}
\boolfalse{LWR@MathJax@silentquotes}

\LWR@subHTMLsanitize

\LWR@strresult must first be set by \LWR@HTMLsanitize, \LWR@HTMLsanitizeexpand, or \CustomizeMathJax.

```
\catcode`\#=12
\catcode`\&=12
\newcommand{\LWR@subHTMLsanitize}{%

    \LWR@replacestrings{<}{&lt;}%

The quotes occasionally causes problems. For mathspec, also allow neutralization of \" and the " character.

```
    \ifbool{LWR@MathJax@silentquotes}

MathJax allows expressions to be defined with \newcommand. These expressions would appear with ## for each argument, and each must be changed to a single #. This must be done after all the above changes. Attempting another conversion after this causes an error upon further expansion.

```

defaults Default customizations:

In the MathJax code, footnotes are only referenced. For equations, they are also generated in the HTML when the LaTeX math is generated inside the HTML comment. For other math

⚠ \footnotemark

environments, the \footnotemark/\footnotetext method must be used. See section 8.5.4 regarding \footnotemark.

For footnotes, \footnotename is used in most cases, however for equation the footnote is picked up from LaTeXin \LWR@doendequation.

First, \footnotename for MathJax is copied from LaTeX.

```
\providecommand{\footnotename}{footnote}

% due to warpMathJax:
\end{warpHTML}

\begin{warpMathJax}
\xdef\LWR@customizedMathJax{\LWR@customizedMathJax%
    \LWRbackslash(%
    \LWRbackslash{}newcommand%
    \{\LWRbackslash{}footnotename\}%
    \{\footnotename\}%
    \LWRbackslash)\par%
}
\end{warpMathJax}
```

\LWRfootnote is set per equation if a footnote is detected in the equation's math expression, otherwise it defaults to \footnotename.

```
\begin{warpMathJax}
\CustomizeMathJax{\def\LWRfootnote{1}}
\CustomizeMathJax{\newcommand{\footnote}[2][\LWRfootnote]{{}^{\mathrm{#1}}}}

\hspace is modified to accept and ignore a star:

# 63 Sectioning

Sectioning and cross-references have been emulated from scratch, rather than try to patch several layers of existing LaTeX code and packages. Formatting is handled by CSS, so the emulated code has much less work to do than the print versions.

Unicode

⚠ accents in filenames

Section names and the resulting filenames with accented characters are partially supported, depending on the ability of *pdflatex* to generate characters and *pdftotext* to read them. If extra symbols appear in the text, it may be that *pdflatex* is actually producing a symbol over or under a character, resulting in *pdftotext* picking up the accent symbol separately.

XeLaTeX and LuaLaTeX directly support accented section and file names, but it may be necessary to use LaTeX accents instead of native Unicode accents. LaTeX accents will have the accents stripped when creating file names, whereas using Unicode accents will create filenames which include accents, which may cause issues with some operating systems.

**for HTML output:**

```
\begin{warpHTML}
```

## 63.1 User-level starred section commands

`\ForceHTMLPage`

For HTML output, forces the next section to be on its own HTML page, if `FileDepth` allows, even if starred. For use with `\printindex` and others which generate a starred section which should be on its own HTML page. Also see `\ForceHTMLTOC`.

For print output, no effect.

```
\newbool{LWR@forcinghtmlpage}
\boolfalse{LWR@forcinghtmlpage}

\newcommand*{\ForceHTMLPage}{%
\global\booltrue{LWR@forcinghtmlpage}%
}
```

`\ForceHTMLTOC`

For HTML output, forces the next section to have a TOC entry, even if starred. For use with `\printindex` and others which generate a starred section which should be in the TOC so that it may be accessed via HTML. Not necessary if used with tocbibind. Also see `\ForceHTMLPage`.

For print output, no effect.

```
\newbool{LWR@forcinghtmltoc}
\boolfalse{LWR@forcinghtmltoc}

\newcommand*{\ForceHTMLTOC}{%
\global\booltrue{LWR@forcinghtmltoc}%

## 63.2 Book class commands

`\mainmatter` Declare the main matter section of the document. Does not reset the page number, which must be consecutive arabic numbers for the HTML conversion.

```
\newbool{LWR@mainmatter}
\DeclareDocumentCommand{\mainmatter}{}{%
\booltrue{LWR@mainmatter}%
}
```

`\frontmatter` Declare the front matter section of the document, using arabic numbering for the internal numbering. Does not reset the page number.

```
\DeclareDocumentCommand{\frontmatter}{}{%
\boolfalse{LWR@mainmatter}%
}
```

`\backmatter` Declare the back matter section of the document. Does not reset the page number.

```
\DeclareDocumentCommand{\backmatter}{}{%
\boolfalse{LWR@mainmatter}
}
```

## 63.3 Sectioning support macros

`\LWR@sectionumber` {⟨*section type*⟩}

Typeset a section number and its trailing space with CSS formatting:

```
\newcommand*{\LWR@sectionnumber}[1]{%
\InlineClass{sectionnumber}{#1}%
}
```

`autosec` A tag used by the TOC and index.

`\LWR@createautosec` {⟨*section type*⟩}

Create an autosection tag.

The use of `\textquotedbl` instead of " provides improved compatibility with xeCJK.

```
\newcommand*{\LWR@createautosec}[1]{%
\LWR@htmltag{%
    #1 % space
```

```
7164     id=\textquotedbl\LWR@print@mbox{autosec-\arabic{page}}\textquotedbl%
7165 }%
7166 }
```

`\LWR@pushoneclose` {⟨*sectiontype*⟩} Stacks the new sectioning level's closing tag, to be used when this section is closed some time later.

⚠ `\LWR@stoppars` must be executed first.

7167

Start a new HTML file unless starred, and if is a shallow sectioning depth.

Exception: Also start a new HTML file for \part*, for appendix.

Generate a new LaTeX page so that TOC and index page number points to the section:

```
\LWR@traceinfo{LWR@section: testing whether to start a new HTML file}%
\IfBooleanT{#1}{\LWR@traceinfo{LWR@section: starred}}%
\ifbool{LWR@forcinghtmlpage}{\LWR@traceinfo{LWR@section: forcinghtmlpage}}{}%
\ifthenelse{%
    \(%
        \(\NOT\equal{#1}{\BooleanTrue}\)\OR%
        \(\cnttest{\@nameuse{LWR@depth#4}}{=}{\LWR@depthpart}\)\OR%
        \(\boolean{LWR@forcinghtmlpage}\)%
    \)%
    \AND%
    \cnttest{\@nameuse{LWR@depth#4}}{<=}{\value{FileDepth}}%
    \AND%
    \(%
        \NOT\boolean{CombineHigherDepths}\OR%
        \cnttest{\@nameuse{LWR@depth#4}}{<=}{\value{LWR@prevFileDepth}}%
    \)%
    \AND%

    \(% phantomsection
        \NOT\isempty{#3}%
        \OR%
        \(\NOT\equal{#1}{\BooleanTrue}\)%
    \)%
}%
```

If so: start a new HTML file:

```
{% new file
    \LWR@traceinfo{LWR@section: new HTML file}%
```

See if there was an optional TOC name entry:

```
    \IfNoValueTF{#2}%
```

If no optional entry

```
        {\LWR@newhtmlfile{#3}}%
```

If yes an optional entry

```
        {\LWR@newhtmlfile{#2}}%
}% new file
```

Else: No new HTML file:

```
{% not new file
```

Generate a new LaTeX page so that TOC and index page number points to the section:

```
    \LWR@traceinfo{LWR@section: not a new HTML file, about to LWR@orignewpage}%
    \LWR@maybe@orignewpage%
}% not new file

```

Remember this section's name for \nameref:

```
\IfValueT{#3}{%
    \LWR@traceinfo{LWR@section: about to LWR@setlatestname}%
    \IfValueTF{#2}{\LWR@setlatestname{#2}}{\LWR@setlatestname{#3}}%
}%
```

Print an opening comment with the level and the name; ex: "section" "Introduction" Footnotes may be used in section names, which would also appear in the HTML section opening comments, so the short TOC entry is used if possible, and a limited opening comment is made if the sectional unit is starred.

```
\ifbool{HTMLDebugComments}{%
    \begingroup%
    \LWR@nullfonts%
    \IfBooleanTF{#1}% starred
    {\LWR@htmlcomment{Opening #4*}}%
    {%
        \IfNoValueTF{#2}% short TOC
            {\LWR@htmlcomment{Opening #4 ``#3''}}%
            {\LWR@htmlcomment{Opening #4 ``#2''}}%
    }\LWR@orignewline%
    \endgroup%
}{}
```

For inline sections paragraph and subparagraph, start a new paragraph now:

```
\ifthenelse{%
    \cnttest{\@nameuse{LWR@depth#4}}{>=}{\LWR@depthparagraph}%
}%
    {\LWR@startpars}%
    {}%
```

Create the opening tag with an autosec:

```
\LWR@traceinfo{LWR@section: about to LWR@createautosec}%
\LWR@createautosec{\@nameuse{LWR@tag#4}}%

\setcounter{LWR@currentautosec}{\value{page}}%
```

Check if starred:

```
\IfBooleanTF{#1}%
{%
    \LWR@traceinfo{LWR@section: starred}%
```

Starred, but also forcing a TOC entry, so add unnumbered TOC name or regular name:

```
    \ifbool{LWR@forcinghtmltoc}%
```

```
    {%
        \addcontentsline{toc}{#4}{%
            \IfValueTF{#2}{\LWR@isolate{#2}}{\LWR@isolate{#3}}%
        }%
    }%
    {}%
}% starred
```

Not starred, so step counter and add to TOC:

```
{% not starred
```

Only add a numbered TOC entry if section number is not too deep:

```
    \ifthenelse{%
        \cnttest{\@nameuse{LWR@depth#4}}{<=}{\value{secnumdepth}}%
    }%
    {% if secnumdepth
```

If in the main matter, step the counter and add the TOC entry. For `article` class, lwarp assumes that all is mainmatter.

```
        \LWR@traceinfo{LWR@section: about to test main matter}%
        \ifbool{LWR@mainmatter}%
        {%
            \LWR@traceinfo{LWR@section: yes mainmatter}%
            \refstepcounter{#4}%
```

Add main matter numbered TOC entry with the TOC name or the regular name:

```
            \LWR@traceinfo{LWR@section: about to addcontentsline}%
            \addcontentsline{toc}{#4}%
            {%
                \protect\numberline{%
                    \@nameuse{pre#4name}%
                    \@nameuse{the#4}%
                    \@nameuse{post#4name}%
                }%
                {%
                    \ignorespaces%
              \IfValueTF{#2}{\LWR@isolate{#2}}{\LWR@isolate{#3}}\protect\relax%
                }%
            }%
            \LWR@traceinfo{LWR@section: finished addcontentsline}%
        }% end of if main matter
```

If not main matter, add unnumbered TOC name or regular name:

```
        {% not main matter
            \LWR@traceinfo{LWR@section: no main matter}%
            \addcontentsline{toc}{#4}{%
                \IfValueTF{#2}{\LWR@isolate{#2}}{\LWR@isolate{#3}}%
            }%
        }% end of not main matter
    }% end of secnumdepth
```

Deeper than secnumdepth, so add an unnumbered TOC entry:

```
    {%
        \addcontentsline{toc}{#4}{%
            \IfValueTF{#2}{\LWR@isolate{#2}}{\LWR@isolate{#3}}%
        }%
    }%
```

For part, print “Part”:

```
    \ifbool{LWR@mainmatter}%
    {%
        \ifthenelse{%
            \(\cnttest{\@nameuse{LWR@depth#4}}{<=}%
                {\value{secnumdepth}}\) \AND%
            \(\cnttest{\@nameuse{LWR@depth#4}}{=}{\LWR@depthpart}\)%
        }%
            {\@partnameformat}%
            {}%
```

Print the section number:

```
        \LWR@traceinfo{LWR@section: about to print section number}%
        \ifthenelse{%
            \cnttest{\@nameuse{LWR@depth#4}}{<=}{\value{secnumdepth}}%

Generate a LaTeX label.

Track the PDF page numbers of the HTML output.

```
\LWR@traceinfo{LWR@section: about to create the LaTeX label}%
\setcounter{LWR@latestautopage}{\value{page}}%
\LWR@newautopagelabel{LWR@currentautosec}\LWR@orignewline%
```

If this is the first section found in this file, create a label for prevous/next links:

```
\ifbool{LWR@setseqfilelabel}{}{%
    \label{\BaseJobname-autofile-\arabic{LWR@htmlseqfilenumber}}%
    \booltrue{LWR@setseqfilelabel}%
}%
```

Start paragraph handing unless is an inline paragraph or subparagraph:

```
\ifthenelse{%
    \cnttest{\@nameuse{LWR@depth#4}}{<}{\LWR@depthparagraph}%
}%
    {\LWR@startpars}%
    {}%
```

If not starred, remember the previous depth to possibly trigger a new HTML page.

HOWEVER, allow a `\part*` to start a new HTML page. This is used by appendix.

A starred section does not trigger a new HTML page at the beginning of this macro, so it should not affect it here at the end either. This became an issue when a `\listoftables` was tested in the middle of the document. The `\chapter*` for the list was not allowing a new HTML page for the section following it while `CombineHigherDepths` was true.

```
\ifthenelse{%
    \NOT\equal{#1}{\BooleanTrue}\OR%

For hypbmsec, a second optional argument or either parenthesis argument is allowed.

Each of these additional arguments are for headers or PDF bookmarks, and are ignored for HTML output.

## 73.5 Patching the lists

`\LWR@patchlists` Patches list environments.

`\LWR@patchlists` remembers `\item` as defined by whatever packages have been loaded, then patches the `itemize`, `enumerate`, and `description` environments and `\item`. This works with the native LaTeX environments, as well as those provided by enumitem, enumerate, and paralist.

# 74 Tabular

This is arguably the most complicated part of the entire package. Numerous tricks are employed to handle the syntax of the LaTeX core and the various tabular-related packages.

## 74.1 Limitations

Tabular mostly works as expected, but pay special attention to the following, especially if working with environments, macros inside tabulars, multirows, siunitx `S` columns, or the packages multirow, longtable, supertabular, or xtab.

**Defining macros and environments:**

⚠ Misplaced alignment tab character &

- When defining environments or macros which include `tabular` and instances of the & character, it may be necessary to make & active before the environment or macro is defined, then restore & to its default catcode after, using the following commands. These are are ignored in print mode.

@ and !
- Only one each of `@` and `!` is used at each column, and they are used in that order.

\multirow
- In `\multirow` cells, the print version may have extra instances of `<`, `>`, `@`, and `!` cells on the second and later rows in the `\multirow` which do not appear in the HTML version.

⚠ \newcolumntype
- `\newcolumntype` is ignored; unknown column types are set to `l`.

**Rules:**

- Doubled `\hlines`, `\midrules`, and vertical rules are supported.

vertical rules
- Vertical rules next to either side of an `@` or `!` column are displayed on both sides of the column.

width and trim
- Width options are honored. Trim options are converted to rounded top corners. Trim corners are not rounded with `@` or `!` columns, and full-width rules ignore trim. When given an optional width, each cell is styled to create the custom border. Without an optional width, the entire row is given a class to assign the standard border.

combined rules
- If you wish to use `\cmidrule` followed by `\bottomrule`, it may be necessary to use:
```
\cmidrule{2-3} \\[-2ex]
\bottomrule
```
The optional `-2ex` is ignored in HTML, but improves the visual formatting in the print output.

⚠ \warpprintonly
⚠ Misplaced \noalign
- For `\toprule` and `\bottomrule`, when combined with a `warpprint` or `warpHTML` environment, if a "Misplaced `\noalign`" error occurs, change
```
This & That \endhead
```
to
```
\warpprintonly{This & That \endhead}
```
and likewise with the other `\end` headings. Keep the `\endfirsthead` row unchanged, as it is still relevent to HTML output.

**Other:**

- tabularx ignores the width, but `X` columns do produce paragraph columns or multicolumns.

longtable headings
- For longtable, place headings and footings which do not apply to HTML inside `\warpprintonly{}`.

⚠ S columns
- For S columns (from the siunitx package), while producing print output, anything non-numeric must be placed inside { } braces, including commands such as `\multirow`. While producing HTML output, though, anything placed inside braces is not seen by lwarp's tabular handling algorithm. To resolve this problem, make a copy of the row, with one version for print output, containing the extra braces, and another version for HTML output, without the extra braces, such as:
```
\warpprintonly{1 & 2 & {\multirow{2}{2cm}{Text}} & 3 \\}
\warpHTMLonly{1 & 2 & \multirow{2}{2cm}{Text} & 3 \\}
```

⚠ tabular inside a 
- In LaTeX, a `tabular` may be placed inside a `minipage`, but in HTML a `<table>` may not be inside a `<span>`. If this situation is detected, a warning is printed instructing the user to isolate the `<span>` using `\warpprintonly` or the `warpprint` environment.

**for HTML output:**
```
\begin{warpHTML}
```

## 74.2 Temporary package-related macros

These macros are temporary placeholders for macros defined by various packages. If the relevent package is not loaded, these placeholders are used instead.

### 74.2.1 arydshln

Emualated by the original LaTeX non-dashed versions.

```
\LetLtxMacro\hdashline\hline
\LetLtxMacro\cdashline\cline
\LetLtxMacro\firsthdashline\hline
\LetLtxMacro\lasthdashline\hline
```

## 74.3 Token lookahead

Used by `\LWR@futurenonspacelet` to look at the next token.

`\LWR@mynexttoken`

```
\newcommand\LWR@mynexttoken\relax
```

`\futurelet` copies the next token then executes a function to analyze it.

`\LWR@futurenonspacelet` does the same, but ignores intervening white space

Based on the booktabs style:

`\LWR@futurenonspacelet`

```
\def\LWR@futurenonspacelet#1{\def\LWR@cs{#1}%
\afterassignment\LWR@fnslone\let\nexttoken= }

\def\LWR@fnslone{\expandafter\futurelet\LWR@cs\LWR@fnsltwo}

\def\LWR@fnsltwo{%
\expandafter\ifx\LWR@cs\@sptoken\let\next=\LWR@fnslthree%
\else\let\next=\nexttoken\fi\next}

\def\LWR@fnslthree{\afterassignment\LWR@fnslone\let\next= }
```

`\LWR@getmynexttoken` Looks ahead and copies the next token into `\LWR@mynexttoken`.

```
\newcommand*{\LWR@getmynexttoken}{%
    \LWR@traceinfo{LWR@getmynexttoken}%
% nothing must follow this next line
    \LWR@futurenonspacelet\LWR@mynexttoken\LWR@tabledatacolumntag
}
```

## 74.4 Tabular variables

In order to support nested tabulars, each of these is used locally. For local counters, etoolbox's \defcounter and lwarp's new \defaddtocounter are used.

Bool LWR@startedrow — True if should print a row tag before this column.

```
\newbool{LWR@startedrow}
\boolfalse{LWR@startedrow}
```

Bool LWR@tabularcelladded — True if have added a data cell for this position.

```
\newbool{LWR@tabularcelladded}
\boolfalse{LWR@tabularcelladded}
```

Ctr LWR@hlines — Number of \hlines or \midrules above the next row.

```
\newcounter{LWR@hlines}
```

Ctr LWR@hdashedlines — Number of arydshln dashed lines above the next row.

```
\newcounter{LWR@hdashedlines}
```

Bool LWR@doingtbrule — True if the next row will have a top/bottom rule above it.

```
\newbool{LWR@doingtbrule}
\boolfalse{LWR@doingtbrule}
```

Bool LWR@doingcmidrule — True if the next row will have a cmidrule above it.

This is used by \LWR@tabularfinishrow to force a final empty row to create the border for the \cmidrule.

```
\newbool{LWR@doingcmidrule}
\boolfalse{LWR@doingcmidrule}
```

Bool LWR@tableparcell — True if are handling a paragraph inside a table cell, so must close the paragraph tag before moving on.

```
\newbool{LWR@tableparcell}
```

Bool LWR@skippingmrowcell — True if are doing an empty \multirow cell, and thus there is no data tag to close.

```
\newbool{LWR@skippingmrowcell}
```

Bool LWR@skippingmcolrowcell — True if are doing an empty \multicolumnrow cell, and thus there is no data tag to close, and do not print @ and ! columns.

```
\newbool{LWR@skippingmcolrowcell}
```

Bool LWR@usedmultirow — Used to error if used \multirow or \multicolumnrow without using \mrowcell or \mcolrowcell.

```
\newbool{LWR@usedmultirow}
```

Bool LWR@foundmrowcell Used to error if used \multirow or \multicolumnrow without using \mrowcell or \mcolrowcell.

```
\newbool{LWR@foundmrowcell}
```

Bool LWR@skipatbang True if just finished a \multicolumn so should not create the trailing @ or ! columns table data cells.

```
\newbool{LWR@skipatbang}
```

Bool LWR@emptyatbang True if finishing a row and should print empty @ or ! column table data cells.

```
\newbool{LWR@emptyatbang}
```

Bool LWR@intabularmetadata True if are in a tabular but not in a data cell. Used to prevent extra HTML breaks if not inside table data.

```
\newbool{LWR@intabularmetadata}
\boolfalse{LWR@intabularmetadata}
```

Bool LWR@exitingtabular When \end is found, turns off the next opening data tag.

```
\newbool{LWR@exitingtabular}
```

Bool LWR@tabularmutemods Mutes HTML output for @, !, < and >.

This is used while printing the final row to generate \bottomrules.

```
\newbool{LWR@tabularmutemods}
```

Bool LWR@validtablecol True if found a valid table column type.

```
\newbool{LWR@validtablecol}
```

Bool LWR@opttablecol True if found a table column optional argument.

```
\newbool{LWR@opttablecol}
```

Used to add a style to a table data cell:

```
\newbool{LWR@tdhavecellstyle}
```

Ctr LWR@tabularDepth Tracks whether & is being used inside a tabular.

```
\newcounter{LWR@tabulardepth}
\setcounter{LWR@tabulardepth}{0}
```

Ctr LWR@tabularpardepth Tracks whether should look ahead at the next token when encountering a \par while processing tabular contents.

When LWR@tabularpardepth is deeper than LWR@tabulardepth then lwarp has started looking at the contents of the tabular, and thus any \pars encountered must be followed by another token lookahead.

```
\newcounter{LWR@tabularpardepth}
\setcounter{LWR@tabularpardepth}{0}

\newcommand*{\LWR@colsresult}{}%temp storage for column format results
\newcommand*{\LWR@pposition}{}
\newcommand*{\LWR@pleft}{}
\newcommand*{\LWR@pright}{}
```

`LWR@tablecolspec` Holds the parsed column specification, of total width `LWR@tabletotalLaTeXcols`, not counting `@` and `!` columns.

Will contain a string such as `llrrccpc`, exactly one letter per LaTeX table column, without `@`, `!`, `>`, `<`, or the vertical bar.

`\LWR@strresult` Holds the result of `Str` functions.

```
\providecommand*{\LWR@strresult}{}
\providecommand*{\LWR@strresulttwo}{}
```

`\LWR@origcolspec` Holds the original column specs given to `tabular`.

```
\newcommand*{\LWR@origcolspec}{}
```

Ctr `LWR@tablecolspecwidth` Holds the number of tokens in the table columns specification.

This is includes one for each `@`, `!`, `<`, `>` column, and also one for each of the parameters of `p`, `@`, `!`, `<`, `>` columns, and three for each `D` column.

(This is not the total # of LaTeX columns in the table.)

```
\newcounter{LWR@tablecolspecwidth}
```

Ctr `LWR@tablecolspecindex` While parsing the LaTeX table column specification, starts at 1 and is incremented per token of the specification.

```
\newcounter{LWR@tablecolspecindex}
```

Ctr `LWR@tableLaTeXcolindex` While producing the table, resets to 1 at the start of the table and also at each end of line, and is incremented by 1 by each ampersand.

```
\newcounter{LWR@tableLaTeXcolindex}
```

Ctr `LWR@tabletotalLaTeXcols` While parsing a table column specification, begins at 0 and increments by 1 per LaTeX table column. Eventually holds the final number of LaTeX table columns in each row, not counting `@` and `!` columns. (In HTML, `@` and `!` cells become their own columns, but are not included in `LWR@tabletotalLaTeXcols`.)

```
\newcounter{LWR@tabletotalLaTeXcols}
```

Ctr `LWR@tabletotalLaTeXcolsnext` Holds the next LaTeX table column index while parsing, equal to one more than `LWR@tabletotalLaTeXcols`.

```
\newcounter{LWR@tabletotalLaTeXcolsnext}
```

LWR@colatspec A data array of specifications for @ columns. The leftmost's index is leftedge, the others are counter values. See section 42.

LWR@colbangspec A data array of specifications for ! columns. The leftmost's index is leftedge, the others are counter values. See section 42.

LWR@colbeforespec A data array of specifications for > columns.

LWR@colafterspec A data array of specifications for < columns.

LWR@colbarspec A data array of specifications for vertical rules.

### 74.5.1 Handling &

**for HTML output:**

```
\begin{warpHTML}
```

& Will behave depending on whether it is being used inside tabular.

& is redefined to test whether it is inside a tabular environment, in which case it performs special processing for HTML conversion. If not, it behaves normally.

```
\newcommand*{\LWR@tabularampersand}{%
    \LWR@traceinfo{LWR@tabularampersand}%
    \ifnumcomp{\value{LWR@tabulardepth}}{>}{0}%
    {%
```

If not skipping a multirow cell, close the current data cell.

```
        \unskip%
        \LWR@closetabledatacell%
```

Move to the next column.

```
        \defaddtocounter{LWR@tableLaTeXcolindex}{1}%
```

Have not yet added data in this column:

```
        \global\boolfalse{LWR@tabularcelladded}%
```

Look at the next token to decide multi or single column data tag.

```
        \LWR@getmynexttoken%
    }%
```

If not inside a tabular, performs the original action:

```
    {%
        \LWR@origampmacro%
    }%
}
```

& is left with its original catcode for now.

tikz package seems to require & be left alone until after tikz has been loaded. Also, cleveref uses the ampersand in one of its options.

& is made active inside a `tabular`.

& is left alone when in math alignments.

### 74.5.2 Filling an unfinished row

`\LWR@tabularfinishrow` Adds empty table cells if necessary to finish the row.

At the end of the table, if any bottom rules are requested then an empty row must be generated to form the borders which show the rules.

```
\newcommand*{\LWR@tabularfinishrow}{%
```

If not exiting the tabular, or doing a rule, or have already started a row, finish this row:

```
    \ifboolexpr{%
        not bool {LWR@exitingtabular} or%
        bool{LWR@doingtbrule} or%
        bool{LWR@doingcmidrule} or%
        test{\ifnumcomp{\value{LWR@hlines}}{>}{0}} or%
        test{\ifnumcomp{\value{LWR@hdashedlines}}{>}{0}} or%
        bool{LWR@startedrow}%
    }{%
```

To temporarily turn off LWR@exitingtabular so that table data tags will still be generated:

If generating a final row for the \bottomrule borders, turn off the @, !, <, and > column output:

```
\ifbool{LWR@exitingtabular}{%
    \booltrue{LWR@tabularmutemods}%
}{%
    \boolfalse{LWR@tabularmutemods}%
}%
```

Locally reenable the table data tags until finished with the final row:

```
\boolfalse{LWR@exitingtabular}%
```

Generate table data tags and ampersands until the right edge:

```
\whileboolexpr{%
    test {
        \ifnumcomp{\value{LWR@tableLaTeXcolindex}}{<}
            {\value{LWR@tabletotalLaTeXcols}}
    } or %
    (%
        bool{LWR@intabularmetadata} and%
        not bool{LWR@tabularcelladded} and%
        test {
            \ifnumcomp{\value{LWR@tableLaTeXcolindex}}{=}
                {\value{LWR@tabletotalLaTeXcols}}
        }%
    )%
}%
{%
    \LWR@tabledatasinglecolumntag%
```

The following is essentially \LWR@tabularampersand with LWR@emptyatbang added to empty the following cells:

```
    \LWR@closetabledatacell%
    \defaddtocounter{LWR@tableLaTeXcolindex}{1}%
    \global\boolfalse{LWR@tabularcelladded}%
    \booltrue{LWR@emptyatbang}%
```

Starts the next cell:

```
    \ifnumcomp{\value{LWR@tableLaTeXcolindex}}{<}
            {\value{LWR@tabletotalLaTeXcols}}%
        {\LWR@getmynexttoken}%
        {}%
}%
```

Reenable the original LWR@exitingtabular to close the entire table:

```
\ifbool{LWR@tabularmutemods}{%
    \booltrue{LWR@exitingtabular}%
}{%
```

```
        \boolfalse{LWR@exitingtabular}%
    }%
    \boolfalse{LWR@tabularmutemods}%

    \boolfalse{LWR@emptyatbang}%
    }{}% ifboolexpr
}
```

## 74.6 Handling \\

Inside tabular, \\ is redefined to \LWR@tabularendofline

Throws away options \\[dim] or *

\LWR@tabularendofline

```
\NewDocumentCommand{\LWR@tabularendofline}{s o}{%
```

Finish the row:

```
    \ifnumcomp{\value{LWR@tableLaTeXcolindex}}{<}
            {\value{LWR@tabletotalLaTeXcols}}%
        {\LWR@tabularfinishrow}%
        {\LWR@closetabledatacell}%
    \LWR@htmltag{/tr}\LWR@orignewline%

```
    \boolfalse{LWR@startedrow}%

Additional setup:

```
    \defcounter{LWR@hlines}{0}%
    \defcounter{LWR@hdashedlines}{0}%
    \boolfalse{LWR@doingtbrule}%
    \boolfalse{LWR@doingcmidrule}%
    \LWR@clearmidrules%

    \def\LWR@rowHTMLcolor{}%
```

Start at first column:

```
    \defcounter{LWR@tableLaTeXcolindex}{1}%
```

Have not yet added data in this column:

```
    \global\boolfalse{LWR@tabularcelladded}%
```

Allow TEX to flush the pending paragraph. Not doing so causes a slowdown for very large tables.

```
    \LWR@stoppars%
    \LWR@origpar%
```

Look at the next token to decide between single column data tag or a special case:

```
    \LWR@getmynexttoken%
}
```

## 74.7 Looking ahead in the column specifications

`\LWR@columnspeclookahead` {⟨*offset*⟩}

Looks `offset` tokens ahead in the column specification, setting `\LWR@strresulttwo`.

The `w` column alignment will be seen as a single unit such as `{c}`.

```
\newcommand*{\LWR@columnspeclookahead}[1]{%

    \addtocounter{LWR@tempcountone}{#1}%
    \fullexpandarg%
    \StrChar{\LWR@origcolspec}{\arabic{LWR@tempcountone}}[\LWR@strresulttwo]%
```

Get the contents of the first group in `\LWR@strresulttwo`:

```

## 74.15 Parsing the column specifications

⚠ tabular baselines

HTML CSS cannot exactly match the LaTeX concept of a baseline for a table row. Table 12 shows the LaTeX results for various vertical-alignment choices, with the baseline of the first column drawn across all the columns for comparison. See the p column specification in table 13 for details.

Table 13 describes how each kind of column is converted to HTML.

`\LWR@parsetablecols` {⟨*colspecs*⟩}

Scans the column specification left to right.

Builds `\LWR@tablecolspec` with the final specification, one LaTeX column per entry. The final number of LaTeX columns in each row is stored in `LWR@tabletotalLaTeXcols`, which

Table 12: Tabular baseline

| l | p | m | b | r |
|---|---|---|---|---|
| | | | bot | |
| | | mid | bot | |
| l | par | mid | bot | r |
| | par | mid | | |
| | par | | | |

Table 13: Tabular HTML column conversions

**l, r, c:** Converted to table cells without paragraph tags.
Uses CSS `vertical-align:middle` so that top or bottom-aligned cells may go above or below this cell.

**p:** Converted to table cells with paragraph tags. Ref: Table 12, LaTeX places the top line of a parbox aligned with the rest of the text line, so CSS `vertical-align:bottom` is used to have the HTML result appear with the paragraph extending below the L, R, C cells at the middle, if possible. This may be confusing as a P cell may not top-align with an L,R,C cell in the HTML conversion, especially in the presence of a B cell, and two P cells side-by-side will be aligned at the bottom instead of the top. Some adjustment of the CSS may be desired, changing `td.tdp`, `td.tdP`, `td.tdprule`, and `td.tdPrule` to `vertical-align: middle`. Another possibility is to change L,R,C, and P to `vertical-align: top` and not worry about the alignment of B and M cells or trying to approximate LaTeX baselines.

**m:** With paragraph tags, CSS `vertical-align:middle`.

**b:** With paragraph tags, CSS `vertical-align:top` so that the bottom of the text is closest to the middle of the text line.

**P, M, B:** Horizontally-centered versions.

**S:** Converted to 'r'. Ignores optional argument. From the siunitx package.

**D:** Converted to 'c'. From the dcolumn package.

**@, !, >, <:** One each, in that order.

**|:** Vertical rule.

**Unknown:** Converted to 'l'.

**`\newcolumn`:** Currently treated as unknown.

is the number of & and \\ in each line, but which does not include @, !, <, > specifications in the count.

```
\newcommand*{\LWR@parsetablecols}[1]{%
    \LWR@traceinfo{LWR@parsetablecols}%
```

Remember the original supplied column spec:

```
    \renewcommand*{\LWR@origcolspec}{#1}%
```

Remove spaces:

```
    \expandarg%
    \StrSubstitute{\LWR@origcolspec}{ }{}[\LWR@origcolspec]%
```

Expand any star columns:

```
    \expandcolspec%
```

The parsed column spec data array, LWR@tablecolspec, will be overwritten with new values.

Total number of columns found so far. Also pre-initialize the first several columns of specs:

```
    \defcounter{LWR@tabletotalLaTeXcols}{0}%
    \defcounter{LWR@tabletotalLaTeXcolsnext}{1}%
    \LWR@setexparray{LWR@colatspec}{leftedge}{}%

    \LWR@setexparray{LWR@colbarspec}{2}{}%
    \LWR@setexparray{LWR@colbarspec}{3}{}%
```

Starting at the first column specification:

```
    \defcounter{LWR@tablecolspecindex}{1}%
```

Place the colspecs string length into \LWR@strresult, and remember the number of characters in the column specification:

```
    \expandarg%
    \StrLen{\LWR@origcolspec}[\LWR@strresult]%
```

```
    \fullexpandarg%
    \LWR@traceinfo{original column spec length: \LWR@strresult}%
    \defcounter{LWR@tablecolspecwidth}{\LWR@strresult}%
```

Haven't seen any optional arguments so far

```
    \boolfalse{LWR@opttablecol}%
```

Scan through the column specifications:

```
    \whileboolexpr{%
        not test{%
            \ifnumcomp{\value{LWR@tablecolspecindex}}{>}%
                {\value{LWR@tablecolspecwidth}}%
        }%
    }%
    {%
```

Place the next single-character column type into `\LWR@strresult`:

```
    \expandarg%
   \StrChar{\LWR@origcolspec}{\arabic{LWR@tablecolspecindex}}[\LWR@strresult]%
    \LWR@traceinfo{position \arabic{LWR@tablecolspecindex}: \LWR@strresult}%
    \fullexpandarg%
```

Not yet found a valid column type:

```
    \boolfalse{LWR@validtablecol}%
```

Skip over any optional arguments, such as siunitx `S` column:

```
    \IfStrEq{\LWR@strresult}{[}{\booltrue{LWR@opttablecol}}{}%
```

Throw away anything found inside the optional argument:

```
    \ifbool{LWR@opttablecol}%
    {}% inside an optional argument
    {% not an optional tabular argument
```

Not inside an optional argument, so consider the column type:

```
    \IfStrEq{\LWR@strresult}{l}{\LWR@parsenormalcolumn{l}}{}%
    \IfStrEq{\LWR@strresult}{c}{\LWR@parsenormalcolumn{c}}{}%
    \IfStrEq{\LWR@strresult}{r}{\LWR@parsenormalcolumn{r}}{}%
    \IfStrEq{\LWR@strresult}{L}{\LWR@parsenormalcolumn{l}}{}%
    \IfStrEq{\LWR@strresult}{C}{\LWR@parsenormalcolumn{c}}{}%
    \IfStrEq{\LWR@strresult}{R}{\LWR@parsenormalcolumn{r}}{}%
    \IfStrEq{\LWR@strresult}{J}{\LWR@parsenormalcolumn{l}}{}%

    \IfStrEq{\LWR@strresult}{S}{\LWR@parsenormalcolumn{c}}{}%
    \IfStrEq{\LWR@strresult}{s}{\LWR@parsenormalcolumn{c}}{}%

    \IfStrEq{\LWR@strresult}{\detokenize{@}}{\LWR@parseatcolumn}{}%
    \IfStrEq{\LWR@strresult}{!}{\LWR@parsebangcolumn}{}%
```

```
    \IfStrEq{\LWR@strresult}{>}{\LWR@parsebeforecolumn}{}%
    \IfStrEq{\LWR@strresult}{<}{\LWR@parseaftercolumn}{}%
    \IfStrEq{\LWR@strresult}{|}{\LWR@parsebarcolumn}{}%
    \IfStrEq{\LWR@strresult}{:}{\LWR@parsecoloncolumn}{}%
    \IfStrEq{\LWR@strresult}{;}{\LWR@parsesemicoloncolumn}{}%

    \IfStrEq{\LWR@strresult}{p}{\LWR@parsepcolumn{p}}{}%
    \IfStrEq{\LWR@strresult}{m}{\LWR@parsepcolumn{m}}{}%
    \IfStrEq{\LWR@strresult}{b}{\LWR@parsepcolumn{b}}{}%

    \IfStrEq{\LWR@strresult}{w}{\LWR@parsewcolumn}{}%
    \IfStrEq{\LWR@strresult}{W}{\LWR@parsewcolumn}{}%
```

A star column:

```
    \IfStrEq{\LWR@strresult}{*}{\LWR@parsestarcolumn}{}%
```

From the dcolumn package:

```
    \IfStrEq{\LWR@strresult}{D}{\LWR@parseDcolumn{c}}{}%
```

From the tabularx package. X column has no parameter, but will be given paragraph tags.

```
    \IfStrEq{\LWR@strresult}{X}{\LWR@parsenormalcolumn{X}}{}%
```

---

Many people define centered versions "P", "M", and "B":

```
  \newcolumntype{P}[1]{>{\centering\arraybackslash}p{#1}}
```

---

```
    \IfStrEq{\LWR@strresult}{P}{\LWR@parsepcolumn{P}}{}%
    \IfStrEq{\LWR@strresult}{M}{\LWR@parsepcolumn{M}}{}%
    \IfStrEq{\LWR@strresult}{B}{\LWR@parsepcolumn{B}}{}%
```

If this column was an invalid column type, convert it to an `l` column:

```
    \ifbool{LWR@validtablecol}{}{%
        \LWR@traceinfo{invalid column type: \LWR@strresult}%
        \LWR@parsenormalcolumn{l}%
    }%
    }% not an optional column argument
```

If read the closing bracket, no longer inside the optional argument:

```
    \IfStrEq{\LWR@strresult}{]}{\boolfalse{LWR@opttablecol}}{}%
```

Move to the next character:

```
    \defaddtocounter{LWR@tablecolspecindex}{1}%
    }% whiledo
}%
```

## 74.16 colortbl and xcolor tabular color support

These macros provide a minimal emulation of some colortbl macros which might appear between table cells. If colortbl is loaded, these macros will be replaced with functional versions.

For each of the HTML colors below, the text for the HTML color is set if requested, but the macro is empty if none has been set.

`\rownum` Reserve a counter register.

```
\@ifundefined{rownum}{\newcount\rownum}{}
```

`\@rowcolors` Emulated in case xcolor is not used.

```
\newcommand*{\@rowcolors}{}
```

`\@rowc@lors` Emulated in case xcolor is not used.

```
\newcommand*{\@rowc@lors}{}
```

`\LWR@xcolorrowHTMLcolor` Emulated xcolor row color.

```
\newcommand*{\LWR@xcolorrowHTMLcolor}{}
```

`\LWR@columnHTMLcolor` HTMLstyle code for the column color.

```
\def\LWR@columnHTMLcolor{}
```

`\LWR@rowHTMLcolor` HTMLstyle code for the row color.

```
\def\LWR@rowHTMLcolor{}
```

`\LWR@cellHTMLcolor` HTMLstyle code for the cell color.

```
\def\LWR@cellHTMLcolor{}
```

`\LWR@ruleHTMLcolor` HTMLstyle code for the rule color.

```
\newcommand*{\LWR@ruleHTMLcolor}{}
```

`\rowcolor` `[`⟨*model*⟩`]` `{`⟨*color*⟩`}` `[`⟨*left overhang*⟩`]` `[`⟨*right overhang*⟩`]` Print version. The HTML version is in lwarp-colortbl. Used before starting a tabular data cell, thus `\LWR@getmynexttoken`.

```
\newcommand*{\rowcolor}{\LWR@getmynexttoken}%
```

`\arrayrulecolor` `[`⟨*model*⟩`]` `{`⟨*color*⟩`}`

\arrayrulecolornexttoken [⟨*model*⟩] {⟨*color*⟩}

Print versions for use outside and inside a `tabular`:

```
\newcommand{\arrayrulecolor}[2][named]{}
\newcommand{\arrayrulecolornexttoken}[2][named]{\LWR@getmynexttoken}
```

\doublerulesepcolor [⟨*model*⟩] {⟨*color*⟩}

\doublerulesepcolornexttoken [⟨*model*⟩] {⟨*color*⟩}

Print versions for use inside and outside a `tabular`:

```
\newcommand{\doublerulesepcolor}[2][named]{}
\newcommand{\doublerulesepcolornexttoken}[2][named]{\LWR@getmynexttoken}
```

## 74.17 Starting a new row

\LWR@maybenewtablerow If have not yet started a new table row, begin one now. Creates a new row tag, adding a class for `hline` or `tbrule` if necessary.

```
\newcommand*{\LWR@maybenewtablerow}
{%
    \ifbool{LWR@startedrow}%
    {}% started the row
    {% not started the row
```

Remember that now have started the row:

```
        \booltrue{LWR@startedrow}%
```

Create the row tag, with a class if necessary.

```
        \booltrue{LWR@intabularmetadata}%
        \ifboolexpr{%
            test{\ifnumcomp{\value{LWR@hlines}}{>}{0}} or%
            test{\ifnumcomp{\value{LWR@hdashedlines}}{>}{0}}%
        }%
        {%
            \LWR@htmltag{tr class=\textquotedbl{}hline\textquotedbl }%
            \LWR@orignewline%
        }%
        {% not doing hline
            \ifbool{LWR@doingtbrule}%
            {%
                \ifdefvoid{\LWR@ruleHTMLcolor}{%
                    \LWR@htmltag{tr class=\textquotedbl{}tbrule\textquotedbl}%
                }{%
                    \LWR@htmltag{%
                        tr class=\textquotedbl{}tbrule\textquotedbl\ % space
                        style=\textquotedbl{}border-top: 1px solid % space
                            \LWR@origpound\LWR@ruleHTMLcolor \textquotedbl{}%
```

```
                    }%
                }%
                \LWR@orignewline%
            }%
            {\LWR@htmltag{tr}\LWR@orignewline}%
        }% end of not doing hline
    }% end of not started the row
}
```

## 74.18 Printing vertical bar tags

`\LWR@printbartag` {⟨*index*⟩}

Adds to a tabular data cell an HTML class name for a left/right vertical bar.

```
\newcommand*{\LWR@printbartag}[1]{%
    \LWR@traceinfo{LWR@printbartag !#1!}%
    \ifboolexpr{bool{LWR@tabularmutemods} or bool{LWR@emptyatbang}}%
    {}% muting or empty
    {% not muting
        \edef\LWR@tempone{\LWR@getexparray{LWR@colbarspec}{#1}}%
        \ifdefempty{\LWR@tempone}{}{ \LWR@tempone}%
    }% not muting
    \LWR@traceinfo{LWR@printbartag done}%
}
```

## 74.19 Printing @ or ! tags

`\LWR@printatbang` {⟨*at — or — bang*⟩} {⟨*index*⟩}

```
\newcommand*{\LWR@printatbang}[2]{%
```

Fetch the column at or bang spec:

```
    \xdef\LWR@atbangspec{\LWR@getexparray{LWR@col#1spec}{#2}}%
    \LWR@traceinfo{atbang: #2 !\LWR@atbangspec!}%
```

Only generate if is not empty;

```
    \ifdefempty{\LWR@atbangspec}%
    {}%
    {% not empty
        \LWR@htmltag{%
            td class=\textquotedbl{}td#1%
            \LWR@subaddcmidruletrim{}{}%
            \LWR@printbartag{#2}%
            \textquotedbl{}%
            \LWR@tdstartstyles%
            \LWR@addcmidrulewidth%
            \LWR@addcdashline%
            \LWR@addtabularrulecolors%
```

```
            \LWR@tdendstyles%
        }%
```

Create an empty cell if muting for the \bottomrule:

```
        \ifboolexpr{bool{LWR@tabularmutemods} or bool{LWR@emptyatbang}}%
        {}%
        {\LWR@atbangspec}%
%
        \LWR@htmltag{/td}\LWR@orignewline%
        \global\booltrue{LWR@tabularcelladded}%
    }% not empty
}%
```

\LWR@addleftmostbartag

```
\newcommand*{\LWR@addleftmostbartag}{%
    \ifnumcomp{\value{LWR@tableLaTeXcolindex}}{=}{1}{%
        \LWR@printbartag{leftedge}%
    }{}%
}
```

\LWR@tabularleftedge

```
\newcommand*{\LWR@tabularleftedge}{%
    \ifnumcomp{\value{LWR@tableLaTeXcolindex}}{=}{1}%
    {%
        \LWR@printatbang{at}{leftedge}%
        \LWR@printatbang{bang}{leftedge}%
    }% left edge
    {}% not left edge
}
```

## 74.20 Data opening tag

\LWR@thiscolspec Temporary storage.

```
\newcommand*{\LWR@thiscolspec}{}
```

\LWR@tabledatasinglecolumntag Print a table data opening tag with style for alignment and color.

```
\newcommand*{\LWR@tabledatasinglecolumntag}%
{%
    \LWR@traceinfo{LWR@tabledatasinglecolumntag}%
    \LWR@maybenewtablerow%
```

Don't start a new paragraph tag if have already started one:

```
    \ifbool{LWR@intabularmetadata}%
    {%
```

If have found the end of tabular command, do not create the next data cell:

```
        \ifbool{LWR@exitingtabular}{}%
        {% not exiting tabular
```

Print the `@` and `!` contents before first column:

```
            \LWR@tabularleftedge%
```

Fetch the current column's alignment character into `\LWR@strresult`:

```
            \xdef\LWR@strresult{%
           \LWR@getexparray{LWR@tablecolspec}{\arabic{LWR@tableLaTeXcolindex}}%
            }%
```

Print the start of a new table data cell:

```
           \LWR@traceinfo{LWR@tabledatasinglecolumntag: about to print td tag}%
            \LWR@htmltag{%
                td class=\textquotedbl{}td%
```

Append this column's spec:

```
                \LWR@strresult%
```

If this column has a cmidrule, add "rule" to the end of the HTML class tag. Also add vertical bar tags.

```
                \LWR@addcmidruletrim%
                \LWR@addleftmostbartag%
                \LWR@printbartag{\arabic{LWR@tableLaTeXcolindex}}%
                \textquotedbl{}%
```

Add styles for rules, alignment:

```
                \LWR@tdstartstyles%
                \LWR@addcmidrulewidth%
                \LWR@addcdashline%

                \xdef\LWR@thiscolspec{%
                    \LWR@getexparray{LWR@tablecolspec}%
                        {\arabic{LWR@tableLaTeXcolindex}}%
                }%
                \LWR@addformatwpalignment{\LWR@thiscolspec}%
```

Add styles for cell and rule colors:

```
                \LWR@addtabularrowcolor%
                \LWR@addtabularrulecolors%

                \LWR@tdendstyles%
            }% HTML td
           \LWR@traceinfo{LWR@tabledatasinglecolumntag: done printing td tag}%
```

If this is a p, m, b, or X column, allow paragraphs:

```
            \ifboolexpr{%
                test{ \ifdefstring{\LWR@strresult}{p} } or
                test{ \ifdefstring{\LWR@strresult}{m} } or
                test{ \ifdefstring{\LWR@strresult}{b} } or
                test{ \ifdefstring{\LWR@strresult}{P} } or
                test{ \ifdefstring{\LWR@strresult}{M} } or
                test{ \ifdefstring{\LWR@strresult}{B} } or
                test{ \ifdefstring{\LWR@strresult}{X} }
            }%
            {% allow pars
           \LWR@traceinfo{LWR@tabledatasinglecolumntag: about to LWR@startpars}%
                \booltrue{LWR@tableparcell}%
                \LWR@startpars%
           \LWR@traceinfo{LWR@tabledatasinglecolumntag: done with LWR@startpars}%
            }% allow pars
            {}% no pars
```

Print the > contents unless muted for the \bottomrule:

```
            \ifboolexpr{bool{LWR@tabularmutemods} or bool{LWR@emptyatbang}}%
            {}%
            {%
           \LWR@getexparray{LWR@colbeforespec}{\arabic{LWR@tableLaTeXcolindex}}%
            }%
            \boolfalse{LWR@intabularmetadata}%
        }% not exiting tabular
    }{}% in tabular metadata
    \LWR@traceinfo{LWR@tabledatasinglecolumntag: done}%
}%
```

## 74.21 Midrules

LWR@midrules — LWR@midrules is a data array (section 42) of columns each containing a non-zero width if a midrule should be created for this column.

LWR@trimlrules — LWR@trimlrules is a data array (section 42) of columns containing l if a midrule should be left trimmed for each column.

LWR@trimrrules — LWR@trimrrules is a data array (section 42) of columns containing r if a midrule should be right trimmed for each column.

LWR@cdashlines — LWR@cdashlines is a data array (section 42) of columns each containing a Y if an arydshln package "cdashed line" should be created for this column.

Len \LWR@heavyrulewidth — The default width of the rule.

```
\newlength{\LWR@heavyrulewidth}
\setlength{\LWR@heavyrulewidth}{.08em}
```

Len \LWR@lightrulewidth — The default width of the rule.

```
\newlength{\LWR@lightrulewidth}
```

```
\setlength{\LWR@lightrulewidth}{.05em}
```

Len `\LWR@cmidrulewidth` The default width of the rule.

```
\newlength{\LWR@cmidrulewidth}
\setlength{\LWR@cmidrulewidth}{.03em}
```

Len `\LWR@thiscmidrulewidth` The width of the next rule, defaulting to `\LWR@cmidrulewidth`.

If not `\LWR@cmidrulewidth`, a style will be used to generate the custom width.

Assigned from the `LWR@midrules` array.

```
\newlength{\LWR@thiscmidrulewidth}
\setlength{\LWR@thiscmidrulewidth}{\LWR@cmidrulewidth}
```

`\LWR@clearmidrules` Start new midrules. Called at beginning of tabular and also at `\\`.

Clears all `LWR@midrules` and `LWR@trimrules` markers for this line.

`\LWR@subcmidrule` {⟨*width*⟩} {⟨*trim*⟩} {⟨*leftcolumn*⟩} {⟨*rightcolumn*⟩}

Marks `LWR@midrules` data array elements to be non-zero widths from left to right columns. Also marks trimming for the L and/or R columns.

`LWR@doingcmidrule` is set to force an empty row at the end of the tabular to create the rule.

`\LWR@addrulewidth` {⟨*thiswidth*⟩} {⟨*defaultwidth*⟩}

If not default width, add a custom style with width and color depending on `thiswidth`.

```
\newcommand{\LWR@addrulewidth}[2]{%

Only add a custom width if thiswidth is different than the defaultwidth, or if a color is being used:

```

        )
    }%
    {}% default width and color
    {% custom width and/or color
```

Ensure that the width is wide enough to display in the browser:

```
        \LWR@forceminwidth{#1}%

Begin adding another style:

```
        \LWR@tdaddstyle%

The style itself:

```
        border-top:\LWR@printlength{\LWR@atleastonept} solid % space

If default gray, the darkness of the color depends on the thickness of the rule:

```

`\LWR@printmccoltype` {⟨*colspec*⟩} Print any valid column type found. Does not print `@`, `!`, `>`, or `<` columns or their associated tokens.

This is printed as part of the table data tag's `class`.

Execute the assigned print function for each token in the column spec:

```

\newcommand{\LWR@multicoltext}{}
```

To find multicolumn right trim:

```
\newcounter{LWR@lastmulticolumn}
```

`\LWR@domulticolumn` [⟨*1: vpos*⟩] [⟨*2: #rows*⟩] {⟨*3: numLaTeXcols*⟩} {⟨*4: numHTMLcols*⟩} {⟨*5: colspec*⟩} {⟨*6: text*⟩}

```
\NewDocumentCommand{\LWR@domulticolumn}{o o m m m +m}{%
    \LWR@traceinfo{LWR@domulticolumn -#1- -#2- -#4- -#5-}%
```

Remember the text to be inserted, and remember that a valid column type was found:

```
    \renewcommand{\LWR@multicoltext}{%
        #6%
        \booltrue{LWR@validtablecol}%
    }%
```

Compute the rightmost column to be included. This is used to create the right trim.

```
    \defcounter{LWR@lastmulticolumn}{\value{LWR@tableLaTeXcolindex}}%
    \defaddtocounter{LWR@lastmulticolumn}{#3}%
    \defaddtocounter{LWR@lastmulticolumn}{-1}%
```

Row processing:

```
    \LWR@maybenewtablerow%
```

Begin the opening table data tag:

```
    \LWR@htmltag{%

        \IfValueT{#2}{ % rows?
            rowspan=\textquotedbl#2\textquotedbl\ %
        }%

        class=\textquotedbl{}td%
```

Print the column type and vertical bars:

```
        \defcounter{LWR@mcolvertbarsl}{0}%
        \defcounter{LWR@mcolvertbarsr}{0}%
        \defcounter{LWR@mcolvertbarsldash}{0}%

        \booltrue{LWR@mcolvertbaronleft}%
        \LWR@parsemulticolumnalignment{#5}{\LWR@printmccoltype}%
```

If this column has a cmidrule, add "rule" to the end of the HTML class tag.

If this position had a "Y" then add "rule" for a horizontal rule:

```
        \LWR@subaddcmidruletrim%
            {%
                \LWR@getexparray{LWR@trimlrules}%

            }%
            {%
                \LWR@getexparray{LWR@trimrrules}%
                    {\arabic{LWR@lastmulticolumn}}%
            }%
```

Also add vertical bar class.

```
        \ifnumcomp{\value{LWR@mcolvertbarsl}}{=}{1}{ tvertbarl}{}%
        \ifnumcomp{\value{LWR@mcolvertbarsl}}{>}{1}{ tvertbarldouble}{}%

```

```
        \ifnumcomp{\value{LWR@mcolvertbarsrdash}}{>}{1}%
            { tvertbarrdoubledash}{}%
```

Close the class tag's opening quote:

```
        \textquotedbl{}%

        \LWR@tdstartstyles%

### 74.23.3 Multicolumn

`\LWR@htmlmulticolumn` {⟨*numcols*⟩} {⟨*alignment*⟩} {⟨*text*⟩}

```
\NewDocumentCommand{\LWR@htmlmulticolumn}{m m +m}%
{%
```

Figure out how many extra HTML columns to add for `@` and `!` columns:

```
    \LWR@tabularhtmlcolumns{\arabic{LWR@tableLaTeXcolindex}}{#1}%
```

Create the multicolumn tag:

```
\LWR@domulticolumn{#1}{\arabic{LWR@tabhtmlcoltotal}}{#2}{#3}%
```

Move to the next LaTeX column:

```
\defaddtocounter{LWR@tableLaTeXcolindex}{#1}%
\defaddtocounter{LWR@tableLaTeXcolindex}{-1}%
```

Skip any trailing `@` or `!` columns for this cell:

```
\booltrue{LWR@skipatbang}%
}
```

### 74.23.4 Longtable captions

longtable captions use `\multicolumn`.

Per the caption package. User-redefinable float type.

```
\providecreP71.373 -2L
```

Star version, show a caption but do not make a LOT entry:

```
    {% yes star
        \LWR@figcaption%
        \LWR@isolate{#3}%
        \endLWR@figcaption%
    }%
    {% No star:
```

Not the star version:

Don't step the counter if `\caption[]{A caption.}`

```
        \ifbool{LWR@starredlongtable}%
        {%
            \ifblank{#2}% TOC entry
            {}%
            {%
                \refstepcounter{\LTcaptype}%
                \protected@edef\@currentlabel{%
                    \@nameuse{p@\LTcaptype}\@nameuse{the\LTcaptype}%
                }%
            }%
        }{}%
```

Create an HTML caption. Afterwards, maybe make a LOT entry.

```
        \LWR@figcaption%
        \LWR@isolate{\@nameuse{fnum@\LTcaptype}}%
        \CaptionSeparator%
        \LWR@isolate{#3}%
        \endLWR@figcaption%
```

See if an optional caption was given:

```
        \ifblank{#2}% TOC entry empty
```

if the optional caption was given, but empty, do not form a TOC entry

```
        {}%
```

If the optional caption was given, but might only be `[]`:

```
        {% TOC entry not empty
            \IfNoValueTF{#2}% No TOC entry?
```

The optional caption is `[]`:

```
            {% No TOC entry
                \addcontentsline%
                {\@nameuse{ext@\LTcaptype}}%
                {\LTcaptype}%
                {%
                    \protect\numberline%
              {\LWR@isolate{\@nameuse{p@\LTcaptype}}\@nameuse{the\LTcaptype}}%
```

```
                    {\ignorespaces \LWR@isolate{#3}\protect\relax}%
                }%
            }% end of No TOC entry
```

The optional caption has text enclosed:

```
            {% yes TOC entry
                \addcontentsline%
                {\@nameuse{ext@\LTcaptype}}%
                {\LTcaptype}%
                {%
                    \protect\numberline%
              {\LWR@isolate{\@nameuse{p@\LTcaptype}}\@nameuse{the\LTcaptype}}%
                    {\ignorespaces \LWR@isolate{#2}\protect\relax}%
                }%
            }% end of yes TOC entry
        }% end of TOC entry not empty
    }% end of no star
```

Skip any trailing `@` or `!` columns for this cell:

```
    \booltrue{LWR@skipatbang}%
    }% end of \LWR@domulticolumn
    \defaddtocounter{LWR@tableLaTeXcolindex}{\value{LWR@tabletotalLaTeXcols}}%
    \defaddtocounter{LWR@tableLaTeXcolindex}{-1}

}
```

### 74.23.5 Counting HTML tabular columns

The LaTeX specification for a table includes a number of columns separated by the `&` character. These columns differ in content from line to line. Additional virtual columns may be specified by the special `@` and `!` columns. These columns are identical from line to line, but may be skipped during a multicolumn cell.

For HTML output, `@` and `!` columns are placed into their own tabular columns. Thus, a LaTeX `\multicolumn` command may span several additional `@` and `!` columns in HTML output. These additional columns must be added to the total number of columns spanned by an HTML multi-column data cell.

```
\newcounter{LWR@tabhtmlcolindex}
\newcounter{LWR@tabhtmlcolend}
\newcounter{LWR@tabhtmlcoltotal}
```

`\LWR@subtabularhtmlcolumns` {⟨*index*⟩}

Factored from `\LWr@tabularhtmlcolumns`, which follows.

```
\newcommand*{\LWR@subtabularhtmlcolumns}[1]{%
```

Temporarily define a macro equal to the `@` specification for this column:

```
    \edef\LWR@atbangspec{\LWR@getexparray{LWR@colatspec}{#1}}%
```

If the @ specification is not empty, add to the count:

```
    \ifdefempty{\LWR@atbangspec}%
        {}%
        {\defaddtocounter{LWR@tabhtmlcoltotal}{1}}%
```

Likewise for the ! columns:

```
    \edef\LWR@atbangspec{\LWR@getexparray{LWR@colbangspec}{#1}}%
    \ifdefempty{\LWR@atbangspec}%
        {}%
        {\defaddtocounter{LWR@tabhtmlcoltotal}{1}}%
}
```

`\LWR@tabularhtmlcolumns` {⟨*starting LaTeX column*⟩} {⟨*number LaTeX columns*⟩}

Compute the total number of HTML columns being spanned, considering the starting LaTeX table column and the number of LaTeX tabular columns being spanned. Any @ and ! columns within this span are included in the total count. The resulting number of HTML columns is returned in the counter `LWR@tabhtmlcoltotal`.

```
\newcommand*{\LWR@tabularhtmlcolumns}[2]{%
```

Count the starting index, compute ending index, and begin with the count being the LaTeX span, to which additional @ and ! columns may be added:

```
    \defcounter{LWR@tabhtmlcolindex}{#1}%
    \defcounter{LWR@tabhtmlcoltotal}{#2}%
    \defcounter{LWR@tabhtmlcolend}{#1}%
    \defaddtocounter{LWR@tabhtmlcolend}{#2}%
```

If at the left edge, add the at/bang columns for the left edge:

```
    \ifnumcomp{\value{LWR@tabhtmlcolindex}}{=}{1}{%
        \LWR@subtabularhtmlcolumns{leftedge}%
    }{}%
```

Walk across the LaTeX columns looking for @ and ! columns:

```
    \whileboolexpr{%
        test {%
        \ifnumcomp{\value{LWR@tabhtmlcolindex}}{<}{\value{LWR@tabhtmlcolend}}%
        }%
    }%
    {%
        \LWR@subtabularhtmlcolumns{\arabic{LWR@tabhtmlcolindex}}%
        \defaddtocounter{LWR@tabhtmlcolindex}{1}%
    }% whiledo
}
```

```
\end{warpHTML}
```

## 74.24 Multirow if not loaded

A default defintion in case multirow is not loaded. This is used during table parsing.

```
\begin{warpHTML}
\newcommand{\multirow}[2][c]{}
\end{warpHTML}
```

## 74.25 Multicolumnrow

A print-mode version is defined here, and is also used during HTML output while inside a `lateximage`.

See section 416 for the HTML versions.

**for HTML & PRINT:**

```
\begin{warpall}
```

`\multicolumnrow` {⟨*1:cols*⟩} {⟨*2:halign*⟩} [⟨*3:vpos*⟩] {⟨*4:numrows*⟩} [⟨*5:bigstruts*⟩] {⟨*6:width*⟩} [⟨*7:fixup*⟩] {⟨*8:text*⟩}

For discussion of the use of `\DeclareExpandableDocumentCommand`, see:
https://tex.stackexchange.com/questions/168434/problem-with-abbreviation-of-multirow-and-multicolumn-latex

`\AtBeginDocument` to adjust after the user may have loaded multirow, which requires several tests to determine which version is loaded and thus which options are available.

```
\AtBeginDocument{
```

`\@ifundefined{@xmultirow}` determines if multirow was never loaded.

Null action if not loaded:

```
\@ifundefined{@xmultirow}
{
\DeclareExpandableDocumentCommand{\LWR@print@multicolumnrow}%
    {+m +m +O{c} +m +O{0} +m +O{0pt} +m}%
    {}%
}% no version of multirow was loaded
{% \@xmultirow defined, so some version of multirow was loaded
```

`\@ifpackageloaded{multirow}` determines if v2.0 or later of multirow was used, which included the `\ProvidesPackage` macro.

The print version:

```
\@ifpackageloaded{multirow}{% v2.0 or newer
\@ifpackagelater{multirow}{2016/09/01}% 2016/09/27 for v2.0
{% v2.0+:
\DeclareExpandableDocumentCommand{\LWR@print@multicolumnrow}%
    {+m +m +O{c} +m +O{0} +m +O{0pt} +m}%
    {\multicolumn{#1}{#2}{\@xmultirow[#3]{#4}[#5]{#6}[#7]{#8}}}%
}
```

```
{% loaded but older, probably not executed:
\DeclareExpandableDocumentCommand{\LWR@print@multicolumnrow}%
    {+m +m +O{c} +m +O{0} +m +O{0pt} +m}%
    {\multicolumn{#1}{#2}{\@xmultirow{#4}[#5]{#6}[#7]{#8}}}%
}
}% packageloaded{multirow}
```

If not `\@ifpackageloaded{multirow}` but `\@xmultirow` is defined, then this must be v1.6 or earlier, which did not `\ProvidesPackage{multirow}`, and did not have the `vposn` option.

```
{% v1.6 or older did not \ProvidePackage
\DeclareExpandableDocumentCommand{\LWR@print@multicolumnrow}%
    {+m +m +O{c} +m +O{0} +m +O{0pt} +m}%
    {\multicolumn{#1}{#2}{\@xmultirow{#4}[#5]{#6}[#7]{#8}}}%
}

}% \@ifundefined{@xmultirow}

\providecommand*{\multicolumnrow}{\LWR@print@multicolumnrow}

}% AtBeginDocument

\end{warpall}
```

## 74.26 Utility macros inside a table

**for HTML output:**

```
\begin{warpHTML}
```

Used to prevent opening a tabular data cell if the following token is one which does not create tabular data:

```
\newcommand*{\LWR@donothing}{}
```

In case array is not loaded:

```
\let\firsthline\relax
\let\lasthline\relax
\newcommand*{\firsthline}{}
\newcommand*{\lasthline}{}
```

In case bigdelim is not loaded:

```
\newcommand*{\ldelim}{}
\newcommand*{\rdelim}{}

\end{warpHTML}
```

## 74.27 Special-case tabular markers

**for HTML & PRINT:**

```
\begin{warpall}
```

```
\newcommand*{\LWR@tabledatacolumntag}%
{%
    \LWR@traceinfo{LWR@tabledatacolumntag}%
```

\show\LWR@mynexttoken to see what tokens to look for

⚠ <table> inside  In LaTeX, a `tabular` may be placed inside a `minipage`, but in HTML a <table> may not be inside a . Since there may be several nested s, with an unknown number of other objects between, it is hard to undo all these s before the <table> then redo them after. The broswer probably compensates for this situation, but formatting may be lost inside the <table> because several things are neutralized inside a . Furthermore, in the HTML output, the entire <table> is placed on a single line of HTML code, since the line breaking commands are neutralized inside a . Since this is such a sloppy situation, a warning is issued here instructing the user to please isolate the  to print-only.

# 75 Cross-references

Sectioning commands have been emulated from scratch, so the cross-referencing commands are custom-written for them. Emulating both avoids several layers of patches.

File `*_html.aux` A new entry in `*_html.aux` is used to remember section name, file, and lateximage depth and number for each label:

```
\newlabel{<labelname>@lwarp}{{<section name>}{<filename>}
                                {<limagedepth>}{<limagenumber>}}
```

Table 14 shows the data structures related to cross-referencing.

**for HTML output:**

```
\begin{warpHTML}

Table 14: Cross-referencing data structures

**Original LaTeX:** (print and HTML)

**\refstepcounter:** Steps the couunter and sets \@currentlabel.

**\@currentlabel:** \p@<ctr>\the<ctr> Updated by \refstepcounter.

**\label:** Writes to the .aux file:
\newlabel{<label>}{{\@currentlabel}{\thepage}}

**\newlabel:** When the .aux file is read, sets \r@<label>.

**\r@<label>:** Set to: {{\@currentlabel}{\thepage}}

**\ref:** Returns the first part of \r@<label>.

**\pageref:** Returns the second part of \r@<label>.

**Added by lwarp:** (HTML only)

**\label:** Adds HTML tags (section 75.3), and another .aux entry (section 75.2). If memoir is used, its \@mem@old@label points to lwarp's version, and cleveref patches.

**\newlabel:** Unchanged. When the .aux file is read, sets \r@<label>@lwarp.

**\r@<label>@lwarp:** Set to {{section_name}{file_name}{depth}{number}}:

**\LWR@nameref:** The section name for this label.

**\LWR@htmlfileref:** The filenumber or name for this label.

**\LWR@lateximagedepthref:** The lateximagedepth for this label.

**\LWR@lateximagenumberref:** The lateximagenumber for this label.

**\nameref:** Emualted from hyperref for lwarp. See section 75.4.

**\ref and \nameref:** Adds HTML tags. See section 75.4.

**Added by amsmath:** (print and HTML)

**\label:** Execution is delayed until the math environment is completed.

**\ltx@label:** LaTeX \label, (HTML: patched by lwarp,) later patched by cleveref.

**Added by cleveref:** (print and HTML)

**\refstepcounter:** Added: sets \cref@currentlabel.

**\cref@currentlabel:** (<type>=<ctr> unless an alias is used):
[<type>][\arabic{<ctr>}][<parent ctrs>]{\p@<ctr>\the<ctr>} Also see section 60.4 for use with footnotes.

**\label:** Writes to the .aux file:
\newlabel{<label>@cref}{{\cref@currentlabel}{\thepage}}

**\newlabel:** Unchanged. When the .aux file is read, sets \r@<label>@cref.

**\r@<label>@cref:** Set to: {{\cref@currentlabel}{\thepage}}

**Utility functions:** See \cref@getlabel, \cref@gettype, \cref@getcounter, \cref@getprefix.

**Cross-referencing names:** \crefname and \Crefname assign human-readable names for references to this counter type.

**Additionally patched by lwarp:** (HTML only)

**\cref, etc.:** Modified for lwarp. See section 196.

**\label inside math:** See section 82.7.1.

**Footnotes:** See \noteentry in section 60.4.

`\LWR@new@label` {⟨*label*⟩}

`\label` during HTML output when not in SVG math mode, removing extra spaces around the label, as done by a regular LaTeX `\label`.

The is also used during a `lateximage`, including SVG math, since the special label handling is required, but `\LWR@label@createtag` does not generate HTML tags inside a `lateximage`.

If memoir is used, it's `\@mem@old@label` is pointed here.

clevereref later encases this to add its own cross-referencing, and also patches memoir.

```

```
    \LWR@orig@label{#1}%
```

Create a special label which holds the section number, `LWR@htmlfilenumber`, `LWR@lateximagedepth`, and `LWR@lateximagenumber`:

```
    \LWR@traceinfo{%
        LWR@new@label: filesectionnames is %

Create the filename part of the link:

```
    \LWR@htmltag{a href=\textquotedbl%
    \LWR@traceinfo{LWR@startref B}%
    \LWR@print@mbox{\LWR@htmlrefsectionfilename{#1}}%
    \LWR@traceinfo{LWR@startref C}%
    \LWR@origpound%

Create the destination id:

See if LWR@lateximagedepth is unknown:

```
    \LWR@traceinfo{LWR@startref D: !#1!}%
    \ifcsundef{r@#1@lwarp}%
```

"??" if LWR@lateximagedepth is unknown, so create a link with an unknown destination:

```
    {%
        \LWR@traceinfo{LWR@startref D0: ??}%
        ??%
    }%
```

If LWR@lateximagedepth is known. Use a lateximage if the depth is greater than zero, or a regular link otherwise:

```
    {%
```

```

\detokenize is used to allow underscores in the labels:

```
                \LWR@print@mbox{\LWR@sanitized}%
            }%
    }%
    \LWR@traceinfo{LWR@startref E}%
```

```

Maybe add a title:

```

    }%
    \LWR@traceinfo{LWR@startref F}%
}
```

\LWR@subnewref {⟨*label*⟩} {⟨*label or sub@label*⟩}

Factored for the subfig package. Uses the original label for the hyper-reference, but prints its own text, such as "1(b)".

```
\NewDocumentCommand{\LWR@subnewref}{m m}{%

}
```

\ref * {⟨*label*⟩} \ref is redefined to \LWR@HTML@ref, except inside the text part of a \hyperref, where it is redefined to \LWR@ref@ignorestar.

\LWR@HTML@ref * {⟨*label*⟩} Create an internal document reference link, or without a link if starred per hyperref.

hyperref defines a starred version. Since hyperref is only emulated, the starred version is defined here for print mode, in case \ref is used inside SVG math:

```
\LWR@absorbstar{ref}%
```

The HTML version:

```
\NewDocumentCommand{\LWR@HTML@ref}{s m}{%

    \IfBooleanTF{#1}%
        {\LWR@print@ref{#2}}%
        {\LWR@subnewref{#2}{#2}}%
}

\LWR@formatted{ref}
```

For MathJax:

```

\CustomizeMathJax{\renewcommand{\ref}{\ifstar\LWRref\LWRref}}
```

\pagerefPageFor Text for page references.

```

`\hyperindexref` {⟨*list of LWR@autoindex, commas, and ranges*⟩}

`\hyperindexref{LWR@autoindex}` is inserted into `*.ind` by the ***makeindex*** style file `lwarp.ist` or the ***xindy*** style file `lwarp.xdy`. For ***xindex***, `\hyperpage` is inserted, which is `\let` to `\hyperindexref`. For ***gindex***, `\addindexitem` and related are inserted, which are defined to use `\hyperindexref`.

The argument is split at commas, and also for ranges, then passed to `\LWR@hyperindexrefsub`.

# 79 Bibliography presentation

**for HTML output:**

```
\begin{warpHTML}
```

`\bibliography` {⟨*filenames*⟩} At one time this was modified to read `\BaseJobname.bbl`, which meant the HTML version could not resolve until the print version was also present. This also confused multibib. It has been reverted to the original to use `\jobname.bbl`.

`\@biblabel` {⟨*text-refnumber*⟩}

```
\renewcommand{\@biblabel}[1]{[#1]\quad}
```

Env `thebibliography` To emphasize document titles in the bibliography, the following redefines `\em` inside `thebibliography` to gather everything until the next closing brace, then display these tokens with `\textit`.

# 80 Restoring original formatting

**for HTML output:**

```
\begin{warpHTML}
```

`\LWR@restoreMathJaxformatting`

A few macros (ref: tcolorbox) must be treated separately while printing the HTML comment for a MathJax expression. These are set here, to which other functions may be appended.

```
\newcommand*{\LWR@restoreMathJaxformatting}{}
```

`\LWR@restoreorigformatting`

Used to temporarily restore the print-mode meaning of a number of formatting, graphics, and symbols-related macros while generating SVG math or a `lateximage`.

Must be used inside a group.

Sets `\LWR@formatting` to `print` until the end of the group.

A number of packages will `\appto` additional actions to this macro.

Various packages add to this macro using `\appto`.

```
\newcommand*{\LWR@restoreorigformatting}{%
    \LWR@traceinfo{LWR@restoreorigformatting}%
```

Numerous macros change their print/HTML meaning depending on `\LWR@formatting`:

```
    \renewcommand*{\LWR@formatting}{print}%
    \linespread{1}%

    \let\par\LWR@origpar%

    \LWR@select@print@hspace%

    \let\enskip\LWR@origenskip%
    \let\quad\LWR@origquad%
    \let\qquad\LWR@origqquad%
```

`\endtabular` must be restored to its original, instead of relying on lwarp's `\LWR@formatted` mechanism:

```
    \LetLtxMacro\endtabular\LWR@origendtabular%
    \csletcs{endtabular*}{LWR@origendtabular*}%

    \LetLtxMacro\noalign\LWR@orignoalign%

%
    \LWR@restoreorigaccents%
    \LWR@restoreoriglists%
%
    \LWR@hook@processingtags%
```

To enable MathJax-specific nullification, used for tcolorbox:

```
    \ifboolexpr{bool{mathjax} or ( bool{FormatWP} and bool{WPMarkMath} ) }%
        {\LWR@restoreMathJaxformatting}%
        {}%
}
```

```
\end{warpHTML}
```

# 81 Nullifying filename formatting

The following are used to nullify certain macros and environments while converting section names to file names.

**for HTML output:**

```

Also commonly used are `\@empty`, `\@gobble`, and `\@firstofone`.

```
\newcommand*{\LWR@dash}{-}

⚠ Use only inside a group.

```
\newbool{LWR@indisplaymathimage}

Measure the depth, width, and height of the math image:

```
    \LWR@singledollarmeasure{#4}%

Set a style for the the height or width. The `em` unit is used so that the math scales according to the user's selected font size.

Start with the greater of the width or the height, biased towards the width:

```

    {%
        \def\LWR@singledollarstyle{%

```

```
        }%
    }%
    {}%
```

If very wide and short, use the width:

```

image filename hashing

If starred, a hashed filename is used.If so, the hash is based on the `alt` tag and also the additional hashing argument.

This may be used to provide an expression with a simple `alt` tag but also enough additional information to provide a unique hash.

An example is when the expression is a complicated TeX expression, which would not copy/paste well. A simplified tag may be used, while the complicated expression is duplicated in the additional hashing argument.

Another example is when the expression is simple, but the image depends on options. These options may be decoded into text form and included in the additional hashing argument in order to make the hash unique according to the set of options, even if the simple `alt` tag is still the same.

MathJax cannot parse the often complicated TeX expressions which appear in the various uses of `\ensuredmath`. `\ensuremath` forces the `alt` tag to "`(math image)`", as translated according to `\MathImageAltText`. Remove existing `equation` environment:

```
\AtBeginDocument{
    \let\equation\relax
    \let\endequation\relax
    \csletcs{equation*}{relax}
    \csletcs{endequation*}{relax}
}
```

Env `equation` The new `equation` environment is created with `\NewEnviron` (from the environ package), which stores the contents of its environment in a macro called `\BODY`.

```
\AtBeginDocument{
    \NewEnviron{equation}%
        {\LWR@doequation{\BODY}{equation}}%
        [\LWR@doendequation{equation}]

    \LetLtxMacro\LWR@equationnormal\equation
    \LetLtxMacro\endLWR@equationnormal\endequation
}% AtBeginDocument
```

Env `equation*`

```
\AtBeginDocument{
    \NewEnviron{equation*}%
        {\LWR@doequation{\BODY}{equation*}}%
        [\LWR@doendequation{equation*}]

    \csletcs{LWR@equationnormalstar}{equation*}
    \csletcs{LWR@endequationnormalstar}{endequation*}
}% AtBeginDocument
```

Remember the "less" version of `equation`, which uses MathJax and `alt` tags, but does not support complicated contents such as some Ti*k*z expressions.

```
\AtBeginDocument{
    \LetLtxMacro\LWR@equationless\equation
```

```
    \LetLtxMacro\endLWR@equationless\endequation
    \csletcs{LWR@equationlessstar}{equation*}
    \csletcs{LWR@endequationlessstar}{endequation*}
}
```

## 82.6 \displaymathnormal and \displaymathother

\displaymathnormal

By default, or when selecting \displaymathnormal, MathJax math display environments print their contents as text into HTML for MathJax to interpret, and SVG display math environments render their contents as SVG images and use their contents as the alt tag of HTML output. To do so, the contents are loaded into a macro for reuse. In some cases, such as complicated Ti*k*z pictures, compilation will fail.

\displaymathother
MathJax unsupported complicated alt tag

When selecting \displaymathother, it is assumed that the contents are more complicated than "pure" math. An example is an elaborate Ti*k*z picture, which will not render in MathJax and will not make sense as an HTML alt tag. In this mode, MathJax is turned off, math display environments become SVG images, even if MathJax is selected, and the HTML alt tags become simple messages. The contents are internally processed as an environment instead of a macro argument, so complicated objects such as Ti*k*z pictures are more likely to compile successfully.

\displaymathnormal
simple math objects

Use when display math environments have simple math which is to sent to MathJax or included in HTML alt tags.

```
\newcommand*{\displaymathnormal}{%
    \ifbool{LWR@origmathjax}{\booltrue{mathjax}}{\boolfalse{mathjax}}%
    \LetLtxMacro\[\LWR@openbracketnormal%
    \LetLtxMacro\]\LWR@closebracketnormal%

    \LetLtxMacro\equation\LWR@equationnormal%
    \LetLtxMacro\endequation\endLWR@equationnormal%
    \csletcs{equation*}{LWR@equationnormalstar}%
    \csletcs{endequation*}{LWR@endequationnormalstar}%
}
```

\displaymathother
complicated math objects

Use when display math environments have complicated objects which will not work with MathJax or should not be included in HTML alt tags. Complicated contents are more likely to compile correctly.

```
\newcommand*{\displaymathother}{%
    \boolfalse{mathjax}%
    \LetLtxMacro\displaymath\LWR@displaymathother%
    \LetLtxMacro\enddisplaymath\endLWR@displaymathother%

## 82.7 AMS Math environments

### 82.7.1 Support macros

Bool `LWR@amsmultline` True if processing a multline environment.

To compensate for `multline`-spefific code, `LWR@amsmultline` is used to add extra horizontal space in `\LWR@htmlmathlabel` if is used in an amsmath environment which is not a `multline` environment and not an `equation`.

```
\newbool{LWR@amsmultline}
\boolfalse{LWR@amsmultline}
```

`\LWR@beginhideamsmath` Starts hiding LaTeX math inside an HTML comment.

```
\newcommand*{\LWR@beginhideamsmath}{
    \LWR@stoppars
    \LWR@origtilde\LWR@orignewline
    \LWR@htmlopencomment

    \begingroup
    \LWR@restoreorigformatting
    \booltrue{LWR@insidemathcomment}
}
```

`\LWR@endhideamsmath` Ends hiding LaTeX math inside an HTML comment.

```
\newcommand*{\LWR@endhideamsmath}{
    \endgroup

    \LWR@htmlclosecomment
    \boolfalse{LWR@insidemathcomment}
    \LWR@orignewline
    \LWR@startpars
}
```

### 82.7.2 Environment patches

The amsmath environments already collect their contents in \@envbody for further processing. eqnarray is not an $\mathcal{AMS}$ package, and thus requires special handling.

For SVG math: Each envrionment is encapsulated inside a lateximage environment, along with a special optional argument of \LWR@amsmathbody or \LWR@amsmathbodynumbered telling lateximage to use as the HTML <alt> tag the environment's contents which were automatically captured by the $\mathcal{AMS}$ environment.

For MathJax: Each environment is syched with LaTeX's equation numbers, typeset with LaTeX inside an HTML comment, then printed to HTML output for MathJax to process.

Env eqnarray This environmnet is not an $\mathcal{AMS}$ environment and thus its body is not automatically captured, so the environ package is used to capture the environment into \BODY.

```
\let\LWR@origeqnarray\eqnarray
\let\LWR@origendeqnarray\endeqnarray
```

To remember whether the starred environment was used, and thus whether to number the equations:

```
\newbool{LWR@numbereqnarray}
\booltrue{LWR@numbereqnarray}
```

Common code used by eqnarray and Beqnarray (from fancybox):

```
\newcommand{\LWR@eqnarrayfactor}{%
```

If mathjax or FormatWP, print the LaTeX expression:

```
    \ifboolexpr{bool{mathjax} or ( bool{FormatWP} and bool{WPMarkMath} ) }%
    {%
```

If MathJax, the environment contents (the \BODY) are executed in a HTML comment to trigger the correct equation number increment (if not starred), then are included verbatim in the output for MathJax to interpret:

```
        \LWR@syncmathjax%
        \boolfalse{LWR@amsmultline}%
        \ifbool{LWR@numbereqnarray}%
        {%
```

If numbering the equations, execute a copy inside an HTML comment block:

```
            \LWR@beginhideamsmath%
            \LWR@origeqnarray%
            \BODY%
            \LWR@origendeqnarray%
            \LWR@endhideamsmath%
```

Then print the (sanitized) contents to the output for MathJax to interpret:

Default to number equations in the future:

```
    \booltrue{LWR@numbereqnarray}%
```

Clear the single-use `alt` text:

```
    \gdef\LWR@ThisAltText{}%
}
```

`eqnarray` itself is made with a blank line before and after to force it to be on its own line:

```
\RenewEnviron{eqnarray}
{%

\LWR@eqnarrayfactor

}
```

The starred version is patched to turn off the numbering:

```
\csgpreto{eqnarray*}{\boolfalse{LWR@numbereqnarray}}

\end{warpHTML}
```

# 83 Lateximages

## 83.1 Description

Env `lateximage` A `lateximage` is a piece of the document which is typeset in LaTeX then included in the HTML output as an image. This is used for math if SVG math is chosen, and also for the `picture`, `tikzpicture`, and other environments.

Before typesetting the `lateximage` a large number of formatting, graphics, and symbols-related macros are temporarily restored to their print-mode meaning by `\LWR@restoreorigformatting`. (See section 80.)

A `lateximage` is typeset on its own PDF page inside an HTML comment which starts on the preceeding page and ends on following page, and instructions are written to `lateximage.txt` for *lwarpmk* to extract the `lateximage` from the page of the PDF file then generate an accompanying `.svg` file image file. Meanwhile, instructions to show this image are placed into the HTML file after the comment.

An HTML `<span>` is created to hold both the HTML comment, which will have the *pdftotext* conversion, and also the link to the final `.svg` image.

A LaTeX label is used to remember which PDF page has the image. A label is used because footnotes, endnotes, and pagenotes may cause the image to appear at a later time. The label is declared along with the image, and so it correctly remembers where the image finally ended up.

HTML `alt` tag The HTML `alt` tag is set to the LaTeX source for SVG math, some chemistry expressions,

\LWR@startingequationtag Prints the starting equation number or tag.

```
\let\LWR@startingequationtag\theLWR@startingequation
```

\LWR@equationtag Prints the ending equation number or tag.

This is reset by lateximage, may be temporarily overwritten by \tag calling \LWR@remembertag.

```
\newcommand*{\LWR@equationtag}{}
```

Only if SVG math, patch \tag after packages have loaded, in case someone else modified \tag.

```
\AtBeginDocument{

\ifbool{mathjax}{}{% not mathjax
```

\LWR@remembertag {⟨*tag*⟩}

```
\NewDocumentCommand{\LWR@remembertag}{m}{%
    \ifbool{LWR@isstartingequation}%
    {%
        \global\boolfalse{LWR@isstartingequation}%
        \xdef\LWR@startingequationtag{#1}%
    }{}%
    \xdef\LWR@equationtag{#1}%
}%

}% not mathjax
}% AtBeginDocument
```

## 83.5 HTML alt tags

\LWR@amsmathbody {⟨*envname*⟩} For use inside the optional argument to a lateximage to add the contents of a AMS math environment to the <alt> tag.

```
\newcommand*{\LWR@amsmathbody}[1]
{%
    \textbackslash\{begin\}\{#1\} % extra space
    \LWR@HTMLsanitizeexpand{\detokenize\expandafter{\the\@envbody}}%
    \textbackslash\{end\}\{#1\}%
}
```

\LWR@amsmathbodynumbered {⟨*envname*⟩} For use inside the optional argument to a lateximage to add the contents of a AMS math environment to the alt tag, prefixed by the equation numbers.

```
\newcommand*{\LWR@amsmathbodynumbered}[1]
```

This may be used to provide an expression with a simple `alt` tag but also enough additional information to provide a unique hash.

An example is when the expression is a complicated TEX expression, which would not copy/paste well. A simplified tag may be used, while the complicated expression is duplicated in the additional hashing argument.

Another example is when the expression is simple, but the image depends on options. These options may be decoded into text form and included in the additional hashing argument in order to make the hash unique according to the set of options, even if the simple `alt` tag is still the same.

File `*_html.aux` A new label is placed into the file `*_html.aux`:

```
\newlabel{LWRlateximage-<BaseJobname>-<number>}{{<x>}{<y>}}
```

This is used to find the image in the PDF file, according to its name.

File `*-images.txt` A list of images to generate is created in `<jobname>-images.txt`. Each line has three pipe-delimited fields, containing the PDF page number from `<jobname>_html.pdf`, where the image is located, a boolean indicating whether the image is hashed, and the filename of the image. The last line has "end" in each field, and is used to detect an incomplete compile.

```
\catcode`\$=\active%

\NewDocumentEnvironment{lateximage}{s O{\ImageAltText} s O{} O{}}
{%
\LWR@traceinfo{lateximage: starting on \jobname.pdf page \arabic{page}}%
\LWR@traceinfo{lateximage: entering depth is \arabic{LWR@lateximagedepth}}%
```

Nested `lateximages` remain one large `lateximage`:

```
\ifnumcomp{\value{LWR@lateximagedepth}}{>}{0}%
```

If nesting inside an already-existing lateximage, simply record one more level. $\mathcal{AMS}$ packages redefine `\addtocounter` to do nothing if inside a `\text`, so lower-level TEX macros are used for tracking nested `lateximages`.

```
{%
%     \addtocounter{LWR@lateximagedepth}{1}%
    \global\advance\c@LWR@lateximagedepth 1\relax% Due to AmS \text macro.
}%
```

Otherwise, this is the outer-most lateximage:

```
{% start of outer-most lateximage
```

Remember the next equation number to be allocated, in case it must be printed in a multi-equation environment:

```
    \LWR@traceinfo{lateximage: starting outer-most lateximage}%
    \setcounter{LWR@startingequation}{\value{equation}}%
```

```
    \addtocounter{LWR@startingequation}{1}%
    \booltrue{LWR@isstartingequation}%
    \let\LWR@startingequationtag\theLWR@startingequation%
```

The default equation tag, unless overwritten by `\tag`:

```
    \let\LWR@equationtag\theequation%
```

Starting a new lateximage:

```
    \addtocounter{LWR@lateximagenumber}{1}%
  \LWR@traceinfo{lateximage: LWR@lateximagenumber is \arabic{LWR@lateximagenumber}}%
```

While inside a lateximage, locally do not use mathjax:

```
    \boolfalse{mathjax}%
```

Be sure that are doing a paragraph:

```
    \LWR@ensuredoingapar%
```

Next file:

```
    \addtocounter{LWR@externalfilecnt}{1}%
  \LWR@traceinfo{lateximage: LWR@externalfilecnt is \arabic{LWR@externalfilecnt}}%
```

Figure out what the next page number will be. `\setcounterpageref` assigns `LWR@LIpage` to the page number for the reference `LWRlateximage-BaseJobname-XXX`:

```
    \setcounterpageref{LWR@LIpage}{%
        LWRlateximage-\BaseJobname-\arabic{LWR@lateximagenumber}%
    }%
    \LWR@traceinfo{lateximage: LWR@LIpage is \arabic{LWR@LIpage}}%
```

Create an HTML span which will hold the comment which contains the ***pdftotext*** translation of the image's page, and also will hold the link to the `.svg` file:

```
    \LWR@htmltag{span\LWR@indentHTML%
        id=\textquotedbl{}%
            lateximage-\BaseJobname-\arabic{LWR@lateximagenumber}%
            \textquotedbl\LWR@indentHTML
        class=\textquotedbl{}lateximagesource\textquotedbl\LWR@orignewline
    }%
```

Write instructions to the `<ImagesDirectory>.txt` file:

```
    \LWR@traceinfo{lateximage: about to write to \BaseJobname-images.txt}%
    \IfBooleanTF{#1}% starred
    {% hash
```

Compute and save the hashed file name for later use:

```
        \ifdefvoid{\LWR@ThisAltText}{%
            \IfBooleanTF{#3}{%
```

```
                \edef\LWR@hashedname{%
                    \LWR@mdfive{\detokenize\expandafter{#2}-!-#4}%
                }%
            }{%
                \edef\LWR@hashedname{%
             \LWR@mdfive{\detokenize\expandafter{\AltTextOpen#2\AltTextClose}-!-#4}%
                }%
            }%
        }{%
            \edef\LWR@hashedname{%
           \LWR@mdfive{\detokenize\expandafter{\AltTextOpen\LWR@ThisAltText\AltTextClose}-!-#4}%
            }%
        }%
        \LWR@traceinfo{lateximage: hash is \LWR@hashedname}%
```

Write the page, hashing, and hashed name:

```
        \immediate\write\LWR@lateximagesfile{%
            |\arabic{LWR@LIpage}|true|\LWR@hashedname|%
        }%
    }% hash
    {% no hash
```

No hash, so write the page, no hashing, and the image number:

```
        \LWR@traceinfo{lateximage: hash false}%
        \immediate\write\LWR@lateximagesfile{%
        |\arabic{LWR@LIpage}|false|\LWR@ImagesName\arabic{LWR@externalfilecnt}|%
        }%
    }% no hash
```

Place an open comment tag. This will hide any traces of the lateximage PDF page which were picked up by *pdftotext*.

```
    \LWR@traceinfo{lateximage: about to create open comment}%
    \LWR@htmlopencomment%
```

One level deeper. At this outer-most `lateximage`, it is known that this is not being used inside an $\mathcal{AMS}$ `\text`, since the outer-most level will never be in math mode.

```
     \addtocounter{LWR@lateximagedepth}{1}%
```

Start the new PDF page:

```
    \LWR@traceinfo{lateximage: about to create a new page}%
    \LWR@maybe@orignewpage%
```

If the current page is larger, typeset the image in a "standard" width page and font size:

```
    \LWR@traceinfo{lateximage: about to create minipage}%
    \ifdimless{\linewidth}{6in}{%
        \LWR@print@minipage{\linewidth}%
    }{%
        \LWR@print@minipage{6in}%
    }%
```

```
    \@nameuse{LWR@print@\LateximageFontSizeName}%
```

Temporarily restore formatting to its PDF definitions: Do not produce HTML tags for \hspace, etc. inside a lateximage.

```
    \LWR@traceinfo{lateximage: about to temporarily restore formatting}%
    \LWR@restoreorigformatting%
```

Use full-page footnotes instead of minipage footnotes. These become HTML footnotes.

```
    \def\@mpfn{footnote}%
    \def\thempfn{\thefootnote}%
    \LetLtxMacro\@footnotetext\LWR@footnotetext%
```

Create the LWRlateximage<number> label:

```
    \LWR@traceinfo{lateximage: about to create label}%
    \LWR@orig@label{LWRlateximage-\BaseJobname-\arabic{LWR@lateximagenumber}}%
    \LWR@traceinfo{lateximage: finished creating the label}%
```

Adjust the rule color to match HTML:

```
    \ifdefvoid{\LWR@ruleHTMLcolor}{}{%
        \LWR@print@arrayrulecolor[HTML]{\LWR@ruleHTMLcolor}%
    }%
```

Enable print-mode math functions:

```
    \LetLtxMacro$\LWR@origdollar%
    \catcode`\$=3% math shift
    \LetLtxMacro\(\LWR@origopenparen%
    \LetLtxMacro\)\LWR@origcloseparen%
```

Only enable print-mode display math if are not already inside display math:

```
    \ifbool{LWR@indisplaymathimage}{}{% not in display math
        \LetLtxMacro\[\LWR@origopenbracket%
        \LetLtxMacro\]\LWR@origclosebracket%
        \let\equation\LWR@origequation%
        \let\endequation\LWR@origendequation%
        \csletcs{equation*}{LWR@origequation*}%
        \csletcs{endequation*}{LWR@origendequation*}%
    }% not in display math
```

For chemformula:

```
    \LetLtxMacro\LWR@newsingledollar$%
    \LetLtxMacro\LWR@newsingledollar$% syntax highlighting

}% end of outer-most lateximage
\LWR@traceinfo{lateximage: finished start of environment}%
}% end of \begin{lateximage}
```

\endlateximage When the lateximage environment closes:

```
{% start of \end{lateximage}
\LWR@traceinfo{lateximage: starting end of lateximage}%
```

Nested more than one deep?

```
\LWR@traceinfo{lateximage: internal depth was \arabic{LWR@lateximagedepth}}%
\ifnumcomp{\value{LWR@lateximagedepth}}{>}{1}%
```

If nesting inside an already existing lateximage, simply record one less level. Uses a lower-level TEX macro due to $\mathcal{AMS}$ \text change of \addtocounter.

```
{%
    \LWR@traceinfo{lateximage: unnesting}%
    \global\advance\c@LWR@lateximagedepth -1\relax%
}%
```

If this is the outer-most lateximage:

```
{% end of outer-most lateximage
```

Finish the lateximage minipage and start a new PDF page:

```
\LWR@traceinfo{lateximage: ending outer-most lateximage}%
    \endLWR@print@minipage%
    \LWR@maybe@orignewpage%
```

Close the HTML comment which encapsulated any traces of the lateximage picked up by *pdftotext*:

```
    \LWR@print@vspace*{.5\baselineskip}%
    \LWR@htmlclosecomment%
    \LWR@traceinfo{lateximage: The page after the image is \arabic{page}}%
```

Create a link to the lateximage, allowing its natural height:

```
    \IfBooleanTF{#1}% starred
    {% hash
        \LWR@lateximage@oneimage{#2}{\LWR@hashedname}{#5}{#3}%
    }% hash
    {% no hash
     \LWR@lateximage@oneimage{#2}{\LWR@ImagesName\theLWR@externalfilecnt}{#5}{#3}%
    }% no hash
```

Be sure that are doing a paragraph:

```
    \LWR@ensuredoingapar%
```

Close the HTML span which has the *pdftotext* comment and also the link to the .svg image:

```
    \LWR@htmltag{/span}%
    \ifbool{HTMLDebugComments}{%
        \LWR@htmlcomment{End of lateximage}%
    }{}%
```

Undo one lateximage level. This is not inside an $\mathcal{AMS}$ `\text`, so regular `\addtocounter` may be used here.

```
    \addtocounter{LWR@lateximagedepth}{-1}%
```

Clear the single-use `alt` text:

```
    \gdef\LWR@ThisAltText{}%
}% end of outer-most lateximage
\LWR@traceinfo{lateximage: exiting depth is \arabic{LWR@lateximagedepth}}%
\LWR@traceinfo{lateximage: done}%
}%
\catcode`\$=3% math shift
\end{warpHTML}
```

**for PRINT output:**

```
\begin{warpprint}
```

Env `lateximage` * [⟨<alt> *tag*⟩] * [⟨*add'l hashing*⟩] [⟨*css style*⟩]

`varwidth` is used to create a box of the natural width of its contents.

```
\NewDocumentEnvironment{lateximage}{s o s o o}
    {\begin{varwidth}[b]{\linewidth}}
    {\end{varwidth}}
```

```
\end{warpprint}
```

## 84 `center`, `flushleft`, `flushright`

**for HTML output:**

```
\begin{warpHTML}
```

Env `center` Replace `center` functionality with css tags:

\centering, \raggedleft, and \raggedright usually have no effect on the HTML output, but they may be used to compare with the next token to identify their use at the start of a float. See \LWR@floatalignment.

# 86 siunitx

Pkg siunitx

The lwarp core passes a few options to siunitx.

fractions

Due to *pdftotext* limitations, fraction output is replaced by symbol output for `per-mode` and `quotient-mode`.

⚠ math mode required

Some units will require that the expression be placed inside math mode.

⚠ tabular

Tabular `S` columns are rendered as simple `c` columns, and tabular `s` columns are not supported. These may be replaced by `c` columns with each cell contained in `\num` or `\si`.

⚠ MathJax

For math mode with SVG display, the original siunitx code is used while generating the SVG image. For text mode, lwarp uses an emulation which provides a very effective HTML interpretation of siunitx. For math expressions while using MathJax, a limited emulation is used. Most functions work reasonably well, but many options cannot be emulated. Complicated parsing such as for `\ang` is not supported. The result usually looks fine, and otherwise is enough to get the meaning across.

Document modifications required for MathJax:

custom units

- Custom units may be added with `\CustomizeMathJax`. See the lwarp-siunitx code for examples.

⚠ unit spacing

- Units work better using ~ between units instead of using periods.

⚠ `\square`, `\cubic`

- To square or cube compound units, enclose the following compound units in braces:

  ```
  \cubic{\centi\meter}
  ```

  Single units do not require braces.

Also see MathJax option, section 8.7.4.

**for HTML output:**

```
\begin{warpHTML}
```

Options for siunitx:

# 87 Graphics print-mode modifications

## 87.1 General limitations

⚠ scale

Avoid using the `\includegraphics` `scale` option. Change:

```
\includegraphics[scale=<xx>]{ . . . }
```

to:

```
\includegraphics[width=<yy>\linewidth]{ . . . }
```

`\includegraphics` file formats

For `\includegraphics` with `.pdf` or `.eps` files, the user must provide a `.pdf` or `.eps` image file for use in print mode, and also a `.svg`, `.png`, or `.jpg` version of the same image for use in HTML.

```
\includegraphics{filename} % print:.pdf/.eps HTML:.svg, etc.
```

For print output, lwarp will automatically choose the `.pdf` or `.eps` format if available, or some other format otherwise. For HTML, one of the other formats is used instead.

If a `.pdf` or `.eps` image is referred to with its file extension, the extension will be changed to `.svg` for HTML:

```
\includegraphics{filename.pdf} % uses .svg in html
\includegraphics{filename.eps} % uses .svg in html
```

Prog pdftocairo

PDF to SVG

To convert a PDF image to SVG, use the utility *pdftocairo*:

Enter ⇒ **`pdftocairo -svg filename.pdf`**

Prog lwarpmk pdftosvg

For a large number of images, use *lwarpmk*:

Enter ⇒ **`lwarpmk pdftosvg *.pdf`** **(or a list of filenames)**

Prog lwarpmk epstopdf

Prog epstopdf

epstopdf package

For EPS images converted to PDF using the package epstopdf, use

Enter ⇒ **`lwarpmk pdftosvg *.PDF`**

to convert to SVG images.

DVI LaTeX

When using DVI *latex*, it is necessary to convert EPS to PDF and then to SVG:

Enter ⇒ **`lwarpmk epstopdf *.eps`** **(or a list of filenames)**

Enter ⇒ **`lwarpmk pdftosvg *.pdf`** **(or a list of filenames)**

PNG and JPG — For PNG or JPGwhile using *pdflatex*, *lualatex*, or *xelatex*, the same file may be used in both print or HTML versions, and may be used with a file extension, but will also be used without the file extension if it is the only file of its base name.

GIF — GIF files may be used for HTML, but another format must also be provided for print output.

file extension priorities — If a file extension is not used, for HTML the file extension priorities are: SVG, GIF, PNG, then JPG.

⚠ graphics vs. graphicx — If using the older graphics syntax, use both optional arguments for `\includegraphics`. A single optional parameter is interpreted as the newer graphicx syntax. Note that viewports are not supported by lwarp — the entire image will be shown.

⚠ viewport

⚠ viewport units — For `\includegraphics`, avoid `px` and `%` units for width and height, or enclose them inside `warpHTML` environments. For font-proportional image sizes, use `ex` or `em`. For fixed-sized images, use `cm`, `mm`, `in`, `pt`, or `pc`. Use the keys `width=.5\linewidth`, or similar for `\textwidth` or `\textheight` to give fixed-sized images proportional to a 6 by 9 inch text area. Do not use the `scale` option, since it is not well supported by HTML browsers.

options — `\includegraphics` accepts `width` and `height`, `origin`, `rotate` and `scale`, plus new `class` and `alt` keys.

HTML class — With HTML output, `\includegraphics` accepts an optional `class=xyz` keyval combination, and if this is given then the HTML output will include that class for the image. The class is ignored for print output.

HTML `alt` tags — Likewise, the `\includegraphics` `alt` key adds an HTML `alt` tag to an image, and is ignored for print output. If not assigned, each image is given an `alt` tag according to `\ImageAltText`.

`\rotatebox` — `\rotatebox` accepts the optional `origin` key.

⚠ browser support — `\rotatebox`, `\scalebox`, and `\reflectbox` depend on modern browser support. The CSS3 standard declares that when an object is transformed the whitespace which they occupied is preserved, unlike LaTeX, so expect some ugly results for scaling and rotating.

## 87.2 Print-mode modifications

**for PRINT output:** For print output, accept and then discard the new `class` key:

```
\begin{warpprint}
\define@key{Gin}{class}{}
\define@key{Gin}{alt}{}
```

Print-mode additions for the overpic package. See section 445 for the HTML version.

```

\newcommand*{\overpicfontsize}{12}
\newcommand*{\overpicfontskip}{14}
```

```
\begin{lrbox}{\LWR@colorminipagebox}%

\end{lrbox}%
```

Sort out the various optional arguments and the background color of none. In each case, the LRbox is placed inside a \fcolorbox.

The current color is remembered, then set to the frame, then the current color is used for the contents.

{%
\LWR@traceinfo{*** fcolorminipage: #2 #4 #8}%
```

Pre-load the contents into an LR box so that they can be used inside a `\fcolorbox`::

`\AtEndPreable` forces cleveref to be loaded last, if it has not yet been loaded by the user.

**for HTML output:**

```
\begin{warpHTML}

    \RequirePackage{cleveref}
}

\end{warpHTML}

# 91 Preexisting label and reference definitions

Remember and patch some label-related defintions. These will be further encased and patched by other packages later.

`\label` and `\pageref` do NOT change their behavior according to print or HTML output, and thus do not use the `\LWR@formatted` system.

**for HTML output:**

```
\begin{warpHTML}

# 92 `picture` environment

Env `picture` The `picture` environment is enclosed inside a `\lateximage`.

**for HTML output:**

```

\AfterEndEnvironment{picture}{\end{lateximage}}
```

```
\end{warpHTML}
```

# 93 Minipages and Boxes

A css flexbox is used for minipages and parboxes, allowing external and internal vertical positioning.

⚠ inline — A line of text with an inline `minipage` or `\parbox` will have the `minipage` or `\parbox` placed onto its own line, because a paragraph is a block element and cannot be made `inline-block`.

placement — `minipages` and `\parboxes` will be placed side-by-side in HTML unless you place a `\newline` between them.

side-by-side — Side-by-side `minipages` may be separated by `\quad`, `\qquad`, `\enskip`, `\hspace`, `\hfill`, or a `\rule`. When inside a `center` environment, the result is similar in print and HTML. Paragraph tags are suppressed between side-by-side `minipages` and these spacing commands, but not at the start or end of the paragraph.

⚠ minipage in a span — There is limited support for `minipages` inside an HTML `<span>`. An HTML `<div>` cannot appear inside a `<span>`. While in a `<span>`, `minipages`, and `\parboxes`, and any enclosed lists have limited HTML tags, resulting in an "inline" format, without markup except for HTML breaks. Use `\newline` or `\par` for an HTML break.

⚠ minipage size — When using `minipage`, `\parbox`, and `fminipage`, a virtual $6 \times 9$ inch text area is used for `\linewidth`, `\textwidth`, and `\textheight`, both for sizing the minipage, and also for its contents.

if width is `\linewidth` — If a `minipage` or `\parbox` is assigned a width of exactly `\linewidth`, in HTML it is automatically given no HTML width, thus allowed to fill the line as needed, similar to how it

## 93.2 Virtual page size

Ctr LWR@virtualpagedepth Used to only reset the line width at the outermost minipage.

```
\newcounter{LWR@virtualpagedepth}
\setcounter{LWR@virtualpagedepth}{0}
```

Env LWR@setvirtualpage * [⟨*columns*⟩]

If not nesting a minipage, adjust \linewidth, \textwidth, and \textheight for a virtual $6 \times 9$ page, and start on a new PDF page to help prevent page overflows.

If starred, force a new page in the PDF before generating more HTML. This may be done to reduce the chance of page overflow when starting a new minipage.

The optional number of columns defaults to 1.

```
\NewDocumentEnvironment{LWR@setvirtualpage}{s O{1}}{%
    \ifnumequal{\value{LWR@virtualpagedepth}}{0}{%
        \IfBooleanT{#1}{\LWR@maybe@orignewpage}%
        \setlength{\linewidth}{6in/#2}%
        \setlength{\textwidth}{6in}%
        \setlength{\textheight}{9in}%
    }{}%
    \addtocounter{LWR@virtualpagedepth}{1}%
}
{\addtocounter{LWR@virtualpagedepth}{-1}}

## 93.3 Footnote handling

Also see section 60 for other forms of footnotes. Minipage footnotes are gathered in section 60.5, and then placed into the document in section 93.4.

## 93.4 Minipage handling

Bool LWR@minipagefullwidth Should the next minipage have no HTML width?

```
\newbool{LWR@minipagefullwidth}
\boolfalse{LWR@minipagefullwidth}
```

Bool LWR@forceminipagefullwidth Should the next minipage have no HTML width? Used to force full width for all minipages in an environment such as tabular or multicols, where the actual width depends on the browser width. Controlled by \useminipagewidths and \ignoreminipagewidths.

```
\newbool{LWR@forceminipagefullwidth}
\boolfalse{LWR@forceminipagefullwidth}
```

\minipagefullwidth Requests that the next minipage have no width tag in HTML:

**for HTML output:**

```
\newcommand*{\minipagefullwidth}{\global\booltrue{LWR@minipagefullwidth}}
```

\UseMinipageWidths Locally requests that minipage widths be honored.

```
\newcommand*{\UseMinipageWidths}{\boolfalse{LWR@forceminipagefullwidth}}
```

\IgnoreMinipageWidths Locally requests that minipage widths be ignored.

```
\newcommand*{\IgnoreMinipageWidths}{\booltrue{LWR@forceminipagefullwidth}}

```

**for PRINT output:**

```
\begin{warpprint}
\newcommand*{\minipagefullwidth}{}

**for HTML output:**

Env minipage [⟨*vert position*⟩] [⟨*height*⟩] [⟨*inner vert position*⟩] {⟨*width*⟩}

The vertical positions may be 'c', 't', or 'b'. The inner position may also be 's'.

When using \linewidth, \textwidth, or \textheight, these are scaled proportionally to a 6×9 inch text area.

```
\NewDocumentEnvironment{LWR@HTML@sub@minipage}{m m m m}
{%
\LWR@traceinfo{minipage}%
```

Start an environment, in which width and height is computed based on a virtual page size instead of the extra-large PDF page used during HTML tag generation.

```
\begin{LWR@setvirtualpage}*%
```

Save the requested width now that \linewidth, etc. are adjusted to virtual size.

```
\setlength{\LWR@minipagewidth}{#4}%
\ifnumequal{\value{LWR@virtualpagedepth}}{1}{%

Compute height:

```

\ifblank{#2}{}{\setlength{\LWR@minipageheight}{#2}}%
```

LaTeX wants to start a paragraph for the virtual minipage, then start a paragraph again for the contents of the minipage, so cancel the paragraph tag handling until the minipage has begun.

```
\ifbool{FormatWP}{\newline}{}%
\LWR@stoppars%
```

If `FormatWP`, add a text frame:

```
\ifbool{FormatWP}{%

\addtocounter{LWR@thisautoidWP}{1}%
\LWR@htmltag{%
    div id=\textquotedbl%
        \LWR@print@mbox{autoidWP-\arabic{LWR@thisautoidWP}}%
    \textquotedbl\ % space
    class=\textquotedbl{}wpminipage\textquotedbl%
}%

}{}%
```

Create the  tag with optional alignment style:

```
\LWR@traceinfo{minipage: creating div class}%
\LWR@htmltag{div class=\textquotedbl{}minipage\textquotedbl\ style=\textquotedbl%
\ifthenelse{\equal{#1}{t}}{\LWR@print@mbox{vertical-align:bottom} ; }{}%
\ifthenelse{\equal{#1}{c}}{\LWR@print@mbox{vertical-align:middle} ; }{}%
\ifthenelse{\equal{#1}{b}}{\LWR@print@mbox{vertical-align:top} ; }{}%
\ifthenelse{\equal{#3}{t}}{\LWR@print@mbox{justify-content:flex-start} ; }{}%
\ifthenelse{\equal{#3}{c}}{\LWR@print@mbox{justify-content:center} ; }{}%
\ifthenelse{\equal{#3}{b}}{\LWR@print@mbox{justify-content:flex-end} ; }{}%
\ifthenelse{\equal{#3}{s}}{\LWR@print@mbox{justify-content:space-between} ; }{}%
```

Print the width and optional height styles:

```
\LWR@traceinfo{minipage: about to print the width of \LWR@printlength{\LWR@minipagewidth}}%
\ifbool{LWR@minipagefullwidth}%
{\global\boolfalse{LWR@minipagefullwidth}}%
{%
    \ifbool{LWR@forceminipagefullwidth}%
        {}%
        {%
            \ifdimequal{#4}{\linewidth}%
                {}%
                {width:\LWR@printlength{\LWR@minipagewidth} ; }%
        }%
}%
\LWR@traceinfo{minipage: about to print the height}%
\ifblank{#2}{}{height:\LWR@printlength{\LWR@minipageheight} ; }%
\textquotedbl%
}%
```

Finish with an empty line to start the contents on a new line.

```

```

```
% The preceding empty line is required.
```

Set the user-accessible line and text width and height values inside the virtual minipage. These do not affect the actual size of the PDF output, but are used by any reference to `\linewidth`, etc. inside the virtual minipage being created here. `\LWR@minipagewidth` was the original then padded by 3em, which is restored here. This is done instead of settings back to #4, in case #4 was `\linewidth`, which was changed to 6in above.

```
\ifnumequal{\value{LWR@virtualpagedepth}}{1}{%
    \addtolength{\LWR@minipagewidth}{-3em}% undo frame padding
}{}%
\setlength{\linewidth}{\LWR@minipagewidth}%
```

`\raggedright` cancels hyphenation, which will be done by HTML instead.

```

Set minipage footnotes:

\let\@footnotetext\@mpfootnotetext%
```

```
\end{LWR@setvirtualpage}%
\LWR@startpars%
\ifbool{FormatWP}{\newline}{}%
```

Prevent paragraph tags around horizontal white space until the start of the next paragraph:

```
\global\booltrue{LWR@minipagethispar}%
\LWR@traceinfo{LWR@minipage: done}%
}

\NewDocumentEnvironment{LWR@HTML@minipage}{O{t} O{} O{t} m}

\fbox {⟨*text*⟩}

Creates a framed inline span enclosing the text.

Create a new HTML version, but don't use it until after xcolor may have loaded:

```
\newcommand{\LWR@HTML@fbox}[1]{%

If the optional inner alignment is not given, use the outer instead:

```

Form the outer minipage depending on whether a height was given. Make the outer minipage larger to compensate for the frame.

```

{\minipage[#1][#2+2\fboxsep+2\fboxrule][\LWR@thisalign]{#4+2\fboxsep+2\fboxrule}}%
{\minipage[#1]{#4+2\fboxsep+2\fboxrule}}%

Capture the contents of the environment:

```
\begin{lrbox}{\LWR@fminipagebox}%

Nest the contents inside an inner minipage of the desired size:

```
\IfValueTF{#2}%
{\minipage[#1][#2][\LWR@thisalign]{#4}}%
{\minipage[#1]{#4}}%
}
{%
```

Close the inner minipage and the LR box with the contents:

```
\endminipage%
\end{lrbox}%

Create a frame around the contents of the environment:

```
\fbox{\usebox{\LWR@fminipagebox}}%

The entire thing is placed inside the outer minipage:

```

```
13081 \newcommand*{\LWR@HTML@rule}[3][]{%

The width is copied into a temporary LaTeX length, from which comparisons and conversions may be made:

```

If it's zero-width then skip the entire rule:

```
\ifthenelse{\lengthtest{\LWR@tempwidth=0pt}}%

If it's non-zero width, set a minimal thickness so that it more reliably shows in the browser:

        \lengthtest{\LWR@tempwidth<1pt}%

Print the span with the converted width and height. The width and height are NOT rounded, since a height of less than 1pt is quite common in LaTeX code.

```
    \LWR@findcurrenttextcolor%
    \LWR@htmltagc{%
    span\LWR@indentHTML%
    style=\textquotedbl%
```

The HTML background color is used to draw the filled rule according to the LaTeX foreground color set by `\textcolor`.

```
    \ifbool{FormatWP}{}{background:\LWR@currenttextcolor ; }%
```

The width and height are printed, converted to PT:

```
    width:\LWR@printlength{\LWR@tempwidth} ; %
    height:\LWR@printlength{\LWR@tempheight} ; %
```

The raise height is converted to a CSS transform. The `*2` raise multiplier is to approximately match HTML output's X height. Conversion to a LaTeX length allows a typical LaTeX expression to be used as an argument for the raise, whereas printing the raise argument directly to HTML output without conversion to a LaTeX length limits the allowable syntax. To do: A superior method would compute a ratio of LaTeX ex height, then print that to HTML with an ex unit.

```
    \ifblank{#1}%
    {}%
```

```
    {%
        \setlength{\LWR@tempraise}{0pt-#1}%
        \setlength{\LWR@tempraise}{\LWR@tempraise*2}%

    }%
```

Display inline-block to place the span inline with the text:

```
    display:inline-block;\textquotedbl\LWR@orignewline%
    }%
```

If formatting for a word processor, approximate with a number of underscores, in case a span of a given width is not supported:

# 107 babel and polyglossia warnings

lwarp prints a message instructing the user how to avoid the following error.

(These are not \PackageWarnings because there may not be a problem.)

lwarp uses cleveref, which has some limitations when using polyglossia, possibly resulting in the error

```
! Undefined control sequence. . . . \__hook begindocument
```

To test compatibility, add

```
\usepackage{cleveref}
```

near the end of the preamble (as the last package to be loaded), and try to compile the print version. It may be necessary to set

```
\setdefaultlanguage{english}
```

or some other language supported by cleveref, then select other languages using \setotherlanguages.

Once the print version works with cleveref and polyglossia, the HTML version should work as well using lwarp.

## § 114 Package abstract

(*Emulates or patches code by* Peter Wilson.)

Pkg abstract abstract is supported and patched by lwarp.

⚠ missing toc If using the number option with file splits, be sure to place the table of contents before the abstract. The number option causes a section break which may cause a file split, which would put a table of contents out of the home page if it is after the abstract.

**for HTML output:** memoir provides an abstract environment even though it is not an article or report class. Meanwhile, lwarp loads book to emulate memoir, but book does not have an abstract environment, so when the abstract package is loaded for emulation there is no pre-existing abstract to redefine, which would cause an error. Thus, a null abstract is provide here:

```
\ProvideDocumentEnvironment{abstract}{}{}{}

# accents

(*Emulates or patches code by* Javier Bezos.)

Pkg accents accents is used as-is for SVG math, and is emulated for MathJax.

```
\LWR@ProvidesPackagePass{accents}[2006/05/12]

\LWR@infoprocessingmathjax{accents}

\CustomizeMathJax{\newcommand{\ring}[1]{\mathring{#1}}}
\CustomizeMathJax{\newcommand{\accentset}[2]{\overset{#1{}}{#2}}}
```

As of this writing, MathJax v3 does not yet support groups for macros, so for \underaccent, the originals are remembered here, then they are temporarily redefined and used inside \underaccent, then restored to their originals. \LARGE gives a reasonable size, and \raise is used to adjust vertically without introducing extra line space.

§ 120 Package

# acronym

(*Emulates or patches code by* Tobias Oetiker.)

Pkg acronym acronym is patched for use by lwarp.

⚠ multiply-defined labels `\acresetall` does not work with cleveref, causing multiply-defined labels. lwarp patches

acronym for HTML, but not for print mode.

**for HTML output:**

```
\LWR@ProvidesPackagePass{acronym}[2015/03/21]
```

Uses \textit instead of \itshape:

```
\renewcommand{\acfia}[1]{%
  {\textit{\AC@acl{#1}}} (\ifAC@starred\acs*{#1}\else\acs{#1}\fi)}
```

Removes the mbox to allow math inside:

```
\renewcommand*\AC@acs[1]{%
%     \mbox{
 \expandafter\AC@get\csname fn@#1\endcsname\@firstoftwo{#1}}
% }
```

Fix for acronym labels in the captions of floats.

```
\renewcommand{\@starttoc}[1]{
\LWR@htmlelementclass{nav}{#1}
\LetLtxMacro\@verridelabel\@gobble
\LWR@orig@starttoc{#1}
\LWR@htmlelementclassend{nav}{#1}
}
```

Modified for cleveref and lwarp:

```
\renewcommand*\AC@und@newl@bel[3]{%
    \@ifundefined{#1@#3}%
    {%
        \global\expandafter\let\csname#2@#3\endcsname\@nnil
        \global\expandafter\let\csname#2@#3@lwarp\endcsname\@nnil% lwarp
        \global\expandafter\let\csname#2@#3@cref\endcsname\@nnil% lwarp
    }%
    {%
        \global\expandafter\let\csname#1@#3\endcsname\relax
        \global\expandafter\let\csname#1@#3@lwarp\endcsname\relax% lwarp
        \global\expandafter\let\csname#1@#3@cref\endcsname\relax% lwarp
    }%
}%

Compute the margins, and limit to positive only:

```
\setlength{\LWR@templengthone}{#3}%
\ifdimcomp{\LWR@templengthone}{<}{0pt}{\setlength{\LWR@templengthone}{0pt}}{}%
\setlength{\LWR@templengthtwo}{#4}
\ifdimcomp{\LWR@templengthtwo}{<}{0pt}{\setlength{\LWR@templengthtwo}{0pt}}{}%

If one column is specified, use a  of class singlecolumn, else use multicols:

```
\newcommand*{\LWR@mcolstype}{multicols}%
\ifnumcomp{#2}{=}{1}{\renewcommand*{\LWR@mcolstype}{singlecolumn}}{}%
```

Help avoid page overflow:

```
\LWR@forcenewpage%

```

File 17 **lwarp-algorithm2e.sty**

## § 124 Package algorithm2e

(*Emulates or patches code by* Christophe Fiorio.)

Pkg algorithm2e algorithm2e is patched for use by lwarp.

For print output, captions are placed according to package options, but for HTML output captions are placed where used. Therefore, to have captions appear at the top of the algorithms for both print and HTML, place each captions at the top of each algorithm.

**for HTML output:**

```
\LWR@ProvidesPackagePass{algorithm2e}[2017/07/18]
```

For the list-of entries:

```
\renewcommand{\l@algocf}[2]{\hypertocfloat{1}{algocf}{loa}{#1}{#2}}
```

Select the lwarp float style according to the algorithm2e style:

```
\newcommand*{\LWR@floatstyle@algocf}{ruled}

\ifdefstring{\algocf@style}{boxed}{%
\renewcommand*{\LWR@floatstyle@algocf}{boxed}
}{}

\ifdefstring{\algocf@style}{boxruled}{%
\renewcommand*{\LWR@floatstyle@algocf}{boxruled}
}{}

\ifdefstring{\algocf@style}{plain}{%
\renewcommand*{\LWR@floatstyle@algocf}{plain}
}{}
```

Paragraph handling to allow line numbers under certain conditions:

```
\newbool{LWR@algocf@dopars}
\booltrue{LWR@algocf@dopars}

\renewcommand{\algocf@everypar}{%
\ifbool{LWR@algocf@dopars}{%
    \ifbool{LWR@doingstartpars}{%
        \ifnumcomp{\value{LWR@lateximagedepth}}{>}{0}%
            {}%
            {%
                \algocf@everyparnl\algocf@everyparhanging%
            }%
    }{}%
}{}%
}
```

lwarp caption handling:

```
\renewcommand{\algocf@makecaption}[2]{%
\LWR@HTML@caption@begin{algocf}%
\LWR@isolate{\algocf@captiontext{#1}{#2}}%
\LWR@HTML@caption@end%
}
```

Print any caption where it is declared:

```
\renewcommand{\algocf@makecaption@plain}[2]{%
    \LWR@HTML@caption@begin{algocf}%
    \LWR@isolate{\algocf@captiontext{#1}{#2}}%
    \LWR@HTML@caption@end%
}

\renewcommand{\algocf@makecaption@boxed}[2]{%
    \LWR@HTML@caption@begin{algocf}%
    \LWR@isolate{\algocf@captiontext{#1}{#2}}%
    \LWR@HTML@caption@end%
}

\renewcommand{\algocf@makecaption@ruled}[2]{%
    \LWR@HTML@caption@begin{algocf}%
    \LWR@isolate{\algocf@captiontext{#1}{#2}}%
    \LWR@HTML@caption@end%
}
```

Turn off line numbering while making the caption:

```
\long\def\algocf@latexcaption#1[#2]#3{% original definition of caption
\boolfalse{LWR@algocf@dopars}%  lwarp
  \par%
  \addcontentsline{\csname ext@#1\endcsname}{#1}%
 {\protect\numberline{\csname the#1\endcsname}{\ignorespaces \LWR@isolate{#2}}}%
  \begingroup%
  \@parboxrestore%
  \if@minipage%
```

```
        {\algocf@seteveryparnl{\relax}}%
    {%
            \KwSty{#2\algocf@typo:}%
        ~##1\par%
    }%
    \algocf@linesnumbered% reset the numbering of the lines
    \ifthenelse{\boolean{algocf@hanginginout}}%
        {\relax}%
        {\algocf@reseteveryparhanging}%
  }%
}%

\renewcommand{\ResetInOut}[1]{}%
```

Each of the following creates a  of a given class, and turns off line numbering while creating the  tags:

```
\renewcommand{\algocf@Vline}[1]{%
    \boolfalse{LWR@algocf@dopars}%
    \begin{BlockClass}{alg2evline}
    \booltrue{LWR@algocf@dopars}%
    #1
    \boolfalse{LWR@algocf@dopars}%
    \end{BlockClass}
    \booltrue{LWR@algocf@dopars}%
}

\renewcommand{\algocf@Vsline}[1]{%
    \boolfalse{LWR@algocf@dopars}%
    \begin{BlockClass}{alg2evsline}
    \booltrue{LWR@algocf@dopars}%
    #1
    \boolfalse{LWR@algocf@dopars}%
    \end{BlockClass}
    \booltrue{LWR@algocf@dopars}%
}

\renewcommand{\algocf@Noline}[1]{%
    \boolfalse{LWR@algocf@dopars}%
    \begin{BlockClass}{alg2enoline}
    \booltrue{LWR@algocf@dopars}%
    #1
    \boolfalse{LWR@algocf@dopars}%
    \end{BlockClass}
    \booltrue{LWR@algocf@dopars}%
}
```

The [H] environment is converted to a regular float, which in HTML is placed where declared. Reusing the regular float allows the [H] version to reuse the ruled and boxed options.

## § 133 Package ar

(*Emulates or patches code by* Agostino De Marco.)

Pkg ar ar is patched for use by lwarp.

Measure and print the width of the supplied glyph.

```

The HTML version of \AR:

```
\newrobustcmd*{\LWR@HTML@AR}{%

Start a hashed lateximage, additionally hashed by the font series, with a width depending on the given glyph:

```
    \begin{lateximage}*[AR][\LWR@f@series][\LWR@ar@printwidth{\LWR@print@AR}]%
```

For text mode, set the font series according to the HTML font series:

```
    \ifmmode\else\csuse{LWR@orig\LWR@f@series series}\fi%
```

Print the original glyph using the newly set font series:

```
    \LWR@print@AR%
```

Done.

```
    \end{lateximage}%

```

Combine the print and HTML versions:

```

## § 135 Package array

Pkg array array is used as-is for print output, and emulated for HTML.

plarray and plextarray do not affect `\firsthline` or `\lasthline`, and so are not affected by the following.

**for HTML output:** Remove the default nullfied macros:

```
\let\firsthline\relax
\let\lasthline\relax

\LWR@ProvidesPackagePass{array}[2018/12/30]

\newcommand*{\LWR@HTML@firsthline}{\LWR@HTMLhline}%

```

File 29 **lwarp-arydshln.sty**

# § 136 Package arydshln

(*Emulates or patches code by* Hiroshi Nakashima.)

Pkg arydshln

arydshln heavily patches tabular code, so the actual package is not used. arydshln is emulated for HTML `tabular`, and reverts to solid rules for SVG math `array` and `tabular` in a `lateximage`.

CSS is not able to display a double-dashed border, so a single-dashed rule is displayed as a single-dashed border, and a double-dashed rule is displayed as a thicker single-dashed border.

For MathJax, limited emulation is provided for math mode.

**for HTML output:**

array is required to allow `\newcolumn` below.

```
\RequirePackage{array}
```

```
\LWR@ProvidesPackageDrop{arydshln}[2018/09/26]
```

Ignored, but included for source compatibility:

```

\def\ADLactivate{}
\def\ADLinactivate{}
\newcommand*{\ADLdrawingmode}[1]{}
\newcommand*{\ADLnoshorthanded}{}
\newcommand*{\dashgapcolor}[2][]{}
\newcommand*{\nodashgapcolor}{}
```

In a `lateximage`, revert to solid vertical rules:

```
\appto\LWR@restoreorigformatting{%
\newcolumntype{:}{|}%
\newcolumntype{;}[1]{|}%
\LetLtxMacro\hdashline\hline%
}
```

Some of these macros are already defined as temporary placeholders in the lwarp core, so they must be redefined here.

The emulated defaults also work for an emulated print mode inside a `lateximage`:

```
\def\hdashline{
%     \adl@hdashline\adl@ihdashline
    \adl@hdashline\adl@inactivehdl
```

```
}
\def\adl@hdashline#1{\noalign{\ifnum0=`}\fi

## § 148 Package backref

(*Emulates or patches code by* David Carlisle and Sebastian Rahtz.)

Pkg backref backref is patched for use by lwarp.

⚠ loading Note that backref must be explicitly loaded, and is not automatically loaded by hyperref when generating HTML output.

**for HTML output:**

```
\LWR@ProvidesPackagePass{backref}[2016/05/21]
```

Force the hyperref option:

```
\def\backref{}

\long\def\hyper@section@backref#1#2#3{%
    \ref{#3}%
}

\let\backrefxxx\hyper@section@backref
```

§ 151 Package

# biblatex

(*Emulates or patches code by* Philipp Lehman.)

Pkg biblatex When biblatex is used, modifications from newfloat may have to be undone.

**for HTML output:**

1. lwarp uses newfloat.
2. For classes with chapters which newfloat does not know about, such as CTEX-related classes, newfloat may modify `\addtocontents`.
3. biblatex, though, wants to patch `\addtocontents`, which causes an error if `\addtocontents` has been changed.
4. Therefore, `\addtocontents` is restored to its original here, since biblatex is about to be loaded.

5. This means that the newfloat's chapterlistsgaps option may no longer work.

```
\ifdef{\newfloat@addtocontents@ORI}{
    \let\addtocontents\newfloat@addtocontents@ORI
}{}
```

hyperref emulation is loaded \AtBeginDocument to avoid an options clash.

```
\AtBeginDocument{\RequirePackage{hyperref}}

\LWR@ProvidesPackagePass{biblatex}[2018/03/04]

The following create hyperlinks to the references. The original code to use hyperref is recreated here, because hyperref is emulated.

Pkg bibunits bibunits is patched for use by lwarp.

## § 153 Package bigdelim

(*Emulates or patches code by* Piet van Oostrum, Øystein Bache, Jerry Leichter.)

Pkg bigdelim bigdelim is used as-is for print or `lateximage`, and patched for HTML.

The delimiters are displayed in HTML by printing the delimiter, the text, and a thick border across the side of the `\multirow` which indicates the actual height of the delimiter. The delimiter character is given a `<span>` class of `ldelim` or `rdelim`, and the default CSS sets this to `font-size:200%`

⚠ use \mrowcell `\ldelim` and `\rdelim` use `\multirow`, so `\mrowcell` must be used in the proper number of empty cells in the same column below `\ldelim` or `\rdelim`, but not in cells which are above or below the delimiter:

```
\CustomizeMathJax{\newcommand{\LWRrdelim}[1][]{\LWRbigdelim~\text{#1}}}

§ 161 Package

# booktabs

(*Emulates or patches code by* Simon Fear.)

Pkg booktabs

booktabs is emulated during HTML output, and used as-is during print output and inside an HTML `lateximage`.

⚠ `\cmidrule`

For MathJax, emulation is provided in math mode, but `\cmidrule` trim must not be used.

**for HTML output:**

If booktabs has already been loaded before lwarp, such as by memoir, use it as-is. If not, the lwarp core will have placed some dummy macros which should be removed before loading the actual booktabs definitions.

```
\@ifpackageloaded{booktabs}{}{
    \LetLtxMacro\toprule\relax

    \LetLtxMacro\addlinespace\relax
    \LetLtxMacro\morecmidrules\relax
    \LetLtxMacro\specialrule\relax
}
```

Next, load the booktabs package:

```
\LWR@ProvidesPackagePass{booktabs}[2019/10/08]

File 79 **lwarp-chemformula.sty**

# § 186 Package chemformula

(*Emulates or patches code by* Clemens Niederberger.)

Pkg chemformula

chemformula is patched for use by lwarp.

The SVG images are hashed according to contents and local options. Global options are assumed to be constant document-wide.

⚠ chemformula with MathJax

chemformula works best without MathJax. If MathJax is used, `\displaymathother` must be used before `array`, and then `\displaymathnormal` may be used after. (The chemformula package adapts to `array`, but does not know about MathJax, and MathJax does not know about chemformula.)

While using MathJax, `\displaymathother` may also be used for other forms of display and inline math which contain chemformula expressions.

**for HTML output:**

```
\LWR@ProvidesPackagePass{chemformula}[2019/10/13]
\ExplSyntaxOn
```

`\ch` Enclose in an inline SVG image or MathJax. The `alt` tag is is the contents of the `\ch` expression. The filename is hashed, and also has additional hashing information based on the local options.

```
\RenewDocumentCommand \ch { O{}m }
 {%
```

To work inside `align` with `\displaymathother`, a simple version must be used to work with chemformula's adaptation to `align`.

```
   \ifnumcomp{\value{LWR@lateximagedepth}}{>}{0}%  lwarp
   {
       \chemformula_ch:nn {#1} {#2}%   original
   }
```

If used as the outer level, must temporarily ensure MathJax is disabled:

```
   {
       \begingroup%
       \boolfalse{mathjax}%
```

An inline image is used, adjusted for the baseline:

```
       \LWR@subsingledollar*{% lwarp
           \textbackslash{}ch\{\LWR@HTMLsanitize{#2}\}% alt text
       }{%
        \protect\LWR@HTMLsanitize{\detokenize\expandafter{#1}}% add'l hashing
       }%
       {%
           \chemformula_ch:nn {#1} {#2}%   original
       }%
       \endgroup%
   }
}
```

\chcpd Similar to \ch.

```

lwarp redefines the $ character, so special handling is required to escape math expressions inside \ch.

This boolean tracks a new kind of escaped math:

```
\bool_new:N      \l__chemformula_first_last_LWRdollar_bool
```

\chemformula_input_escape_math

Adds additional escaping for the new dollar definition:

```
\cs_gset_protected:Npn \__chemformula_input_escape_math:n #1
  {
    \__chemformula_first_last_math:n {#1}
    \bool_if:NT \l__chemformula_first_last_dollar_bool
      {
        \bool_set_true:N \l__chemformula_first_last_math_bool
        \__chemformula_read_escape_dollar:w #1 \q_nil
      }
    \bool_if:NT \l__chemformula_first_last_mathbraces_bool
      {
        \bool_set_true:N \l__chemformula_first_last_math_bool
        \__chemformula_read_escape_mathbraces:w #1 \q_nil
      }
```

Added by lwarp:

```
    \bool_if:NT \l__chemformula_first_last_LWRdollar_bool%      lwarp
      {                                                         lwarp
        \bool_set_true:N \l__chemformula_first_last_math_bool%  lwarp
        \__chemformula_read_escape_LWRdollar:w #1 \q_nil%       lwarp
      }
  }
```

\chemformula_read_escape_LWRdollar

The following parses the contents inside the new dollars.

lwarp keeps the dollar as its original math shift until the document starts. While chemmacros is being patched, the dollar must temporarily be set to its new meaning during the following definition.

```
\begingroup
\catcode`\$=\active

\cs_new_protected:Npn \__chemformula_read_escape_LWRdollar:w $#1$ \q_nil
{
    \__chemformula_read_escape_math:n {#1}
}

\endgroup
```

\chemformula_bool_set_if_first_last

The following looks at the first and last tokens for delimiters to escape math inside \ch. The original definition is modified to look for the control sequences which are used by the new meaning of $.

```
\cs_new_protected:Npn \__chemformula_bool_cs_set_if_first_last:NnNN #1#2#3#4

§ 187 Package

# chemgreek

(*Emulates or patches code by* Clemens Niederberger.)

Pkg chemgreek chemgreek is patched for use by lwarp.

Greek symbols
⚠ package selection To use text-mode symbols, use packages textalpha or textgreek. Using the other packages supported by chemgreek will result in math-mode greek characters, which will result in SVG images being used. These images will be hashed.

⚠ XeLaTeX, LuaLaTeX If using XeLaTeX or LuaLaTeX, select the `fontspec` mapping:

```
\selectchemgreekmapping{fontspec}
```

**for HTML output:**

```
\LWR@ProvidesPackagePass{chemgreek}[2020/01/16]

\ExplSyntaxOn

\cs_gset_protected:Npn \chemgreek_text:n #1
  { { \text {#1} } }

File 81 **lwarp-chemmacros.sty**

§ 188 Package

# chemmacros

(*Emulates or patches code by* Clemens Niederberger.)

Pkg chemmacros chemmacros is patched for use by lwarp.

**for HTML output:**

```
\LWR@ProvidesPackagePass{chemmacros}[2017/08/28]
```

SVG file hashing assumes that the relevent options are constant for the entire document.

## § 188.1 Changes to the user's document

⚠ \makepolymerdelims

When using \makepolymerdelims, enclose the entire expression inside a polymerdelims environment, such as (from the chemmacros manual):

```
\begin{polymerdelims}
\chemfig{-[@{op,.75}]CH_2-CH(-[6]Cl)-[@{cl,0.25}]}
\makepolymerdelims{5pt}[27pt]{op}{cl}
\end{polymerdelims}
```

---

⚠ redox reactions

Redox reactions must be enclosed inside a redoxreaction environment. For print output, extra space must be included above and/or below the result, so they are declared as arguments to the environment, instead of being manually entered as per the chemmacros manual. For HTML output, the extra space is ignored and a lateximage is used instead.

```
\begin{redoxreaction}{7mm}{7mm}
\OX{a,Na} $\rightarrow$ \OX{b,Na}\pch\redox(a,b){oxidation}
\end{redoxreaction}
```

## § 188.2 Code

## § 188.3 Loading modules

Patching chemmacros modules must be done \AtBeginDocument, since modules are invoked by the user in the preamble, and each patch is only done if the module is loaded.

```
\ExplSyntaxOn

\newcommand{\@ifchemmacrosmoduleloaded}[1]{%
\@ifl@aded{\c__chemmacros_module_extension_tl}{\c__chemmacros_module_prefix_tl.#1}%
}

\ExplSyntaxOff
```

## § 188.4 New environments

\makepolymerdelims and redox reactions must be enclosed in a lateximage during HTML output. These environments are provided here in HTML mode, and in the lwarp core in print mode, as a high-level semantic syntax which automatically embeds the contents in a lateximage with an appropriate alt tag.

Env polymerdelims

```
\DeclareDocumentEnvironment{polymerdelims}{}
{\begin{lateximage}[-chemmacros- polymer]}
{\end{lateximage}}
```

Env redoxreaction {⟨*space above*⟩} {⟨*space below*⟩}

For HTML output, the above and below space is ignored, and a lateximage is used instead. For the print output version, see section 89.

```
\DeclareDocumentEnvironment{redoxreaction}{m m}
{\begin{lateximage}[-chemmacros- redoxreaction]}
{\end{lateximage}}

\ExplSyntaxOn
```

If hyperref is loaded, cleveref defines starred versions of the following, but since hyperref is only emulated, starred versions are defined here:

Pkg cmbright cmbright is used as-is for SVG math, and is emulated for MathJax.

⚠ limitations The MathJax emulation ignores all package options, except `slantedGreek` is honored, and `\mathbold` is available.

The dedicated macros for upright Greek letters do work correctly.

SVG math should appear the same as the printed output.

Pkg colonequals colonequals is used as-is for SVG math, and is emulated for MathJax.

Since Unicode symbols are not available for each of the following, only two are used for the single and double colons, and the other symbols are derived in a consistent manner. Occasional negative space is added as well. This may need to be undone for some fonts.

§ 233 Package

# enumerate

Pkg enumerate enumerate is supported with no changes.

This package is only required because it was used in the past to drop and then emulate the package. It cannot be removed because an older version which dropped the package may still remain, for example in a local vs. distribution directory, but it is now supported directly by lwarp and thus must no longer be dropped.

**for HTML output:**
```
\LWR@ProvidesPackagePass{enumerate}[2015/07/23]
```

File 127 **lwarp-enumitem.sty**

## § 234 Package enumitem

(*Emulates or patches code by* Javier Bezos.)

Pkg enumitem enumitem is supported with minor adjustments.

**for HTML output:**
```
\LWR@ProvidesPackagePass{enumitem}[2018/11/30]
```

\newlist {⟨*name*⟩} {⟨*type*⟩} {⟨*maxdepth*⟩}
\renewlist {⟨*name*⟩} {⟨*type*⟩} {⟨*maxdepth*⟩}

For enumitem lists, new lists must have the start and end actions assigned to the new environment. Renewed lists already have their actions assigned, and thus need no changes.

```
\let\LWR@enumitem@orignewlist\newlist

§ 237 Package

# epsfig

Pkg epsfig epsfig is emulated for use by lwarp.

⚠ Only the LaTeX2e syntax is emulated.

**for HTML output:**

```
\LWR@ProvidesPackagePass{epsfig}[2017/06/25]
```

A few additional keys to capture the filename:

```
\RequirePackage{graphics}

\define@key{igraph}{file}{%
    \xdef\LWR@epsfig@filename{#1}%
}

\define@key{igraph}{figure}{%
    \xdef\LWR@epsfig@filename{#1}%
}

\define@key{igraph}{prolog}{}

\define@key{igraph}{silent}[]{}
```

The captured filename is used as the argument to `\includegraphics`:

```
\newcommand{\LWR@HTML@epsfig}[1]{\includegraphics[#1]{\LWR@epsfig@filename}}
\LWR@formatted{epsfig}

\newcommand{\LWR@HTML@psfig}[1]{\includegraphics[#1]{\LWR@epsfig@filename}}

# § 238 Package epstopdf

Pkg epstopdf

Previous versions of lwarp had a nullfied version, but now epstopdf-base is supported. lwarp-epstopdf becomes a placeholder to overwrite previous versions.

See package epstopdf-base for details.

**for HTML output:**

# § 239 Package epstopdf-base

Pkg epstopdf-base

⚠ convert to .svg

Images with an .eps extension will be converted to .pdf. The HTML output uses the .svg version, so use

Enter ⇒ **lwarpmk pdftosvg <listofPDFfiles>**

to generate .svg versions.

**for HTML output:**

```
\LWR@ProvidesPackagePass{epstopdf-base}[2020-01-24]
```

Redefine to remember the image filename, replacing `.pdf` with `.svg`. Use the epstopdf print version inside a `lateximage`.

```
\newcommand*{\LWR@HTML@ETE@OrgGin@setfile}[3]{%
    \edef\LWR@tempone{#3}%
    \StrSubstitute{\LWR@tempone}{.pdf}{.svg}[\LWR@tempone]%
    \StrSubstitute{\LWR@tempone}{.PDF}{.SVG}[\LWR@tempone]%
    \xdef\LWR@parsedfilename{\LWR@tempone}%
}

\LWR@formatted{ETE@OrgGin@setfile}
```

`\includegraphics` in HTML mode redefines `\Gin@setfile` to be `\LWR@HTML@Gin@setfile`, which is now redirected to epstopdf's version:

```
\renewcommand*{\LWR@HTML@Gin@setfile}[3]{%
    \ETE@Gin@setfile{#1}{#2}{#3}%
}
```

Allow `.eps` images to be found if a suffix is not provided:

```
\AtBeginDocument{
\DeclareGraphicsExtensions{%
    .eps,.EPS,.svg,.SVG,.gif,.GIF,.png,.PNG,.jpg,.JPG,.jpeg,.JPEG%
}
\DeclareGraphicsRule{.svg}{svg}{.svg}{}
\DeclareGraphicsRule{.SVG}{svg}{.SVG}{}
}
```

Likewise when inside a `lateximage`:

```
\appto\LWR@restoreorigformatting{%
\DeclareGraphicsExtensions{%
    .eps,.EPS,.pdf,.PDF,.gif,.GIF,.png,.PNG,.jpg,.JPG,.jpeg,.JPEG%
}%
}

## § 245 Package etoc

Pkg etoc etoc is ignored. All commands are nullified.

⚠ `\tableofcontents` with `\ref`

The etoc package uses a non-standard syntax which looks ahead after a `\tableofcontents` for a following `\ref`. These `\ref`s appear in the HTML result unless they are removed. Where a `\tableofcontents` is followed by `\ref`, and perhaps also `\label` as well, enclose all of them inside `\warpprintonly`:

```
\warpprintonly{\tableofcontents \ref{toc:abc} \label{toc:def}}
```

or place all code related to a local `\tableofcontents` inside a `warpprint` environment.

⚠ home page

Be sure to keep the initial `\tableofcontents` on the home page, perhaps in its own `\warpHTMLonly` macro or `warpHTML` environment.

framing alternatives

`\fbox` works with fancybox. Also see lwarp's `\fboxBlock` macro and `fminipage` environment for alternatives to `\fbox` for framing environments.

framed table example

The fancybox documentation's example of a framed table using an `\fbox` containing a `tabular` does not work with lwarp, but the `FramedTable` environment does work if `\fbox` is replaced by `\fboxBlock`. This method does lose some HTML formatting. A better method is to enclose the table's contents inside a `fminipage` environment. The caption may be placed either inside or outside the `fminipage`:

```
\begin{table}
\begin{fminipage}{\linewidth}
\begin{tabular}{lr}
. . .
\end{tabular}
\end{fminipage}
\end{table}
```

⚠ framed verbatim

lwarp does not support the `verbatim` environment inside a span, box, or fancybox's `\Sbox`, but a `verbatim` may be placed inside a `fminipage`. The fancybox documentation's example `FramedVerb` may be defined as:

```
\newenvironment{FramedVerb}[1] % width
{
  \VerbatimEnvironment
  \fminipage{#1}
  \beginVerbatim
}{
  \endVerbatim
  \endfminipage
}
```

framed `\VerbBox`

fancybox's `\VerbBox` may be used inside `\fbox`.

indented alignment

`LVerbatim`, `\LVerbatimInput`, and `\LUseVerbatim` indent with horizontal space which may not line up exactly with what *pdftotext* detects. Some lines may be off slightly in their left edge.

fancybox, fancyvrb
⚠ `\VerbatimFootnotes`
⚠ sectioning or displaymath

If using fancybox or fancyvrb with `\VerbatimFootnotes`, and using footnotes in a sectioning command or display math, use `\footnotemark` and `\footnotetext`:

```
\subsection[Subsection Name]
    {Subsection Name\protect\footnotemark}
\footnotetext{A footnote with \verb+verbtim+.}
```

and likewise for equations or display math.

At present there is a bug such that paragraph closing tags are not present in footnotes when \VerbatimFootnotes are selected. The browser usually compensates.

```
\LWR@ProvidesPackagePass{fancybox}[2010/05/15]
```

After the preamble is loaded, after any patches to Verbatim:

```
\AfterEndPreamble{
\LWR@traceinfo{Patching fancybox.}
```

\VerbatimFootnotes Patched to use the new version.

```
\def\VerbatimFootnotes{%
\let\@footnotetext\V@footnotetext%
\let\LWR@footnotetext\V@footnotetext% lwarp
}
```

\V@@footnotetext Patches in a subset of lwarp's \LWR@footnotetext to the fancyvrb version of \V@@footnotetext.

```
\def\V@@footnotetext{%
\LWR@traceinfo{V@footnotetext}%
\global\setbox\LWR@footnotebox=\vbox\bgroup%
```

Add to any current footnotes:

```
    \unvbox\LWR@footnotebox%
```

Remember the footnote number for \ref:

```
    \protected@edef\@currentlabel{%
        \csname p@footnote\endcsname\@thefnmark%
    }% @currentlabel
```

Use HTML superscripts in the footnote even inside a lateximage:

```
    \renewrobustcmd{\textsuperscript}[1]{\LWR@htmlspan{sup}{##1}}%
```

Use paragraph tags if in a tabular data cell or a lateximage:

```
    \ifthenelse{%
        \boolean{LWR@doingstartpars} \AND%
        \cnttest{\value{LWR@lateximagedepth}}{=}{0}%
    }%
        {}%
        {\LWR@htmltagc{\LWR@tagregularparagraph}\LWR@orignewline}%
```

Append the footnote to the list:

```
    \@makefntext{}%
```

The footnote text will follow after \V@@@footnotetext has completed.

```
  \bgroup%
  \aftergroup{\V@@@footnotetext}%
  \ignorespaces%
}%

}% AfterEndPreamble
```

```
\renewcommand*{\@shadowbox}[1]{%
\ifbool{FormatWP}%
{\InlineClass[border:1px solid black]{shadowbox}{#1}}%
{\InlineClass{shadowbox}{#1}}%
}

\renewcommand*{\@doublebox}[1]{%
\ifbool{FormatWP}%
{\InlineClass[border:1px double black]{doublebox}{#1}}%
{\InlineClass{doublebox}{#1}}%
}

\renewcommand*{\@ovalbox}[2]{%
\ifbool{FormatWP}%
{\InlineClass[border:1px solid black; border-radius:1ex]{ovalbox}{#2}}%
{%
    \ifthenelse{\isequivalentto{#1}{\thinlines}}%
        {\InlineClass{ovalbox}{#2}}%
        {\InlineClass{Ovalbox}{#2}}%
}%
}
```

Convert minipages, parboxes, and lists into linear text using the LWR@nestspan environment:

```
\let\LWR@origSbox\Sbox

\def\Sbox{\LWR@origSbox\LWR@nestspan}

\let\LWR@origendSbox\endSbox

\def\endSbox{\endLWR@nestspan\LWR@origendSbox}
```

Beqnarray is adapted for MathJax or enclosed inside a lateximage:

```
\RenewEnviron{Beqnarray}
{\LWR@eqnarrayfactor}

\csgpreto{Beqnarray*}{\boolfalse{LWR@numbereqnarray}}
```

\GenericCaption is enclosed in an HTML block:

```
\renewcommand{\GenericCaption}[1]{%
\LWR@figcaption%
\LWR@isolate{#1}%
\endLWR@figcaption%
}
```

Btrivlist is enclosed in an HTML block. This is a tabular, and does not use \item.

\trivlist {⟨*l/c/r*⟩} [⟨*t/c/b*⟩]

```
\RenewDocumentEnvironment{Btrivlist}{m o}
```

```
{%
    \LWR@stoppars%
    \begin{BlockClass}{Btrivlist}%
    \tabular{#1}%
}
{%
    \endtabular%
    \end{BlockClass}%
    \LWR@startpars%
}
```

`Btrivlist` is also neutralized when used inside a span:

```
\AtBeginEnvironment{LWR@nestspan}{%
\RenewDocumentEnvironment{Btrivlist}{m o}{}{}%
}
```

lwarp's handling of `\item` is patched to accept fancybox's optional arguments:

```
\let\LWRFB@origitemizeitem\LWR@itemizeitem
\let\LWRFB@origdescitem\LWR@descitem

\RenewDocumentCommand{\LWR@itemizeitem}{d()o}{%
    \IfValueTF{#2}{%
        \LWRFB@origitemizeitem[#2]%
    }{%
        \LWRFB@origitemizeitem%
    }%
}

\RenewDocumentCommand{\LWR@descitem}{d()o}{%
    \IfValueTF{#2}{%
        \LWRFB@origdescitem[#2]~%
    }{%
        \LWRFB@origdescitem%
    }%
}

\RenewDocumentCommand{\LWR@nestspanitem}{d()}{%
\if@newlist\else{\LWR@htmltagc{br /}}\fi%
\LWR@origitem%
}
```

The various boxed lists become regular lists:

```
\renewenvironment{Bitemize}[1][]{\begin{itemize}}{\end{itemize}}
\renewenvironment{Benumerate}[1][]{\begin{enumerate}}{\end{enumerate}}
\renewenvironment{Bdescription}[1][]{\begin{description}}{\end{description}}
```

`\boxput` simply prints one then the other argument, side-by-side instead of above and behind:

```
\RenewDocumentCommand{\boxput}{s d() m m}{%
```

```

§ 256 Package

# fbox

(*Emulates or patches code by* Herbert Voss.)

Pkg fbox fbox is patched for use by lwarp.

**for HTML output:**

```
1 \LWR@ProvidesPackagePass{fbox}[2020/06/22]
```

This will be \LWR@formatted when \AtBeginDocument:

```
2 \LetLtxMacro\LWR@HTML@fbox\fbox
```

Instead of using the original, the new version is used with all borders:

```
3 \renewcommand*{\orig@fbox}{\FBox@i[tblr]}
```

\WR@fboxpkg@border {⟨*1: top/bottom/left/right*⟩} {⟨*2: padding, or empty*⟩}

Accumulates HTML styles for border, and padding if given:

```
4 \newcommand*{\LWR@fboxpkg@border}[2]{%
5     \appto\LWR@tempone{%
6         border-#1: % space
7         \LWR@printlength{\LWR@atleastonept} % space
8         solid \LWR@origpound\LWR@tempcolor ;\LWR@indentHTML
9     }%
10    \ifblank{#2}{}{%
11        \appto\LWR@tempone{%
12            padding-#1: \LWR@printlength{#2} ;\LWR@indentHTML
13        }%
14    }%
15 }
```

A hack to reuse the same code for inline and blocks:

```
16 \newbool{LWR@fboxpkg@ispar}
17 \boolfalse{LWR@fboxpkg@ispar}
```

Acculumate HTML styles for left and right padding, depending on \if@fbox@space@left, \if@fbox@space@right:

```
18 \newcommand{\LWR@fboxpkg@lrpadding}[1]{%
19     \csuse{if@fbox@space@#1}%
20         \appto\LWR@tempone{%
21             padding-#1: \LWR@printlength{\fbox@@sep};\LWR@indentHTML
22         }
23     \else%
```

```
        \appto\LWR@tempone{%
            padding-#1: 0pt;\LWR@indentHTML
        }
    \fi%
}
```

The HTML version, modified to use HTML styles and either an `\InlineClass` or `BlockClass`:

```
\newcommand{\LWR@HTML@FBox@iii}[1]{%
```

Find and set the text color, rule width, margin:

```
    \LWR@forceminwidth{\fbox@@rule}%
    \LWR@findcurrenttextcolor%
    \def\LWR@tempone{%
        color: \LWR@origpound\LWR@tempcolor ; \LWR@indentHTML
        margin: 1ex ; \LWR@indentHTML
    }%
```

Add left/right padding:

```
    \LWR@fboxpkg@lrpadding{left}%
    \LWR@fboxpkg@lrpadding{right}%
```

Per the original to decode the borders, in a new way:

```
    \ifnum\the\@tempcntb>8\relax
        \advance\@tempcntb by -8
        \LWR@fboxpkg@border{top}{\fbox@@sep}%
    \fi
    \ifnum\@tempcntb>3
        \advance\@tempcntb by -4
        \LWR@fboxpkg@border{left}{}%
    \fi
    \ifnum\@tempcntb>1
        \LWR@fboxpkg@border{right}{}%
    \fi
    \ifodd\@tempcntb
        \LWR@fboxpkg@border{bottom}{\fbox@@sep}%
    \fi
```

Generate a `BlockClass` or `\InlineClass` with the contents:

```
    \color@begingroup
    \ifbool{LWR@fboxpkg@ispar}%
        {%
            \begin{BlockClass}[\LWR@tempone]{fboxpkg}%
                #1%
            \end{BlockClass}%
        }%
        {%
            \InlineClass[\LWR@tempone]{fboxpkg}{%
                #1%
            }%
        }%
```

```
    \color@endgroup
    \boolfalse{LWR@fboxpkg@ispar}% globally
}
\LWR@formatted{FBox@iii}
```

For \fparbox, set the use of BlockClass, then reuse the above:

```
\long\def\LWR@HTML@FParBox@i[#1]#2{%
    \booltrue{LWR@fboxpkg@ispar}%
    \FBox@i[#1]{#2}
}
\LWR@formatted{FParBox@i}

\long\def\LWR@HTML@FParBox@ii#1{%
    \booltrue{LWR@fboxpkg@ispar}%
    \FBox@i[tblr]{#1}%
}
\LWR@formatted{FParBox@ii}
```

For MathJax, absorb and ignore star and optional arguments:

```
\CustomizeMathJax{\let\LWRorigfbox\fbox}
\CustomizeMathJax{\newcommand{\LWRfboxpkgtwo}[2][]{\LWRorigfbox{#2}}}
\CustomizeMathJax{\renewcommand{\fbox}{\ifstar\LWRfboxpkgtwo\LWRfboxpkgtwo}}

⚠ Misplaced alignment tab character &

Use `\StartDefiningTabulars` and `\StopDefiningTabulars` before and after defining macros using `\ttabbox` with a tabular inside. See section 8.10.1.

⚠ subfig package

When combined with the subfig package, while inside a `subfloatrow` `\ffigbox` and `\ttabbox` must have the caption in the first of the two of the mandatory arguments.

⚠ `\FBwidth`, `\FBheight`

The emulation of floatrow does not support `\FBwidth` or `\FBheight`. These values are pre-set to `.3\linewidth` and `2in`. Possible solutions include:

- Use fixed lengths. lwarp will scale the HTML lengths appropriately.
- Use `warpprint` and `warpHTML` environments to select appropriate values for each case.
- Inside a `warpHTML` environment, manually change `\FBwidth` or `\FBheight` before the `\ffigbox` or `\ttabbox`. Use `\FBwidth` or `\FBheight` normally afterwards; it will be used as expected in print output, and will use your custom-selected value in HTML output. This custom value will be used repeatedly, until it is manually changed to a new value.

After everything has loaded, remember whether subcaption was loaded. If not, it is assumed that subfig is used instead:

```
\newbool{LWR@subcaptionloaded}

\AtBeginDocument{
\@ifpackageloaded{subcaption}
    {\booltrue{LWR@subcaptionloaded}}
    {\boolfalse{LWR@subcaptionloaded}}
}
```

`\floatbox` `[`⟨*1 preamble*⟩`]` `{`⟨*2 captype*⟩`}` `[`⟨*3 width*⟩`]` `[`⟨*4 height*⟩`]` `[`⟨*5 vert pos*⟩`]` `{`⟨*6 caption*⟩`}` `{`⟨*7 object*⟩`}`

Only parameters for captype, width, caption, and object are used.

`LWR@insubfloatrow` is true if inside a `subfloatrow` environment.

There are two actions, depending on the use of subcaption or subfig.

```
\NewDocumentCommand{\floatbox}{o m o o o +m +m}{%
\ifbool{LWR@subcaptionloaded}%
{% subcaption
```

For subcaption:

```
    \ifbool{LWR@insubfloatrow}%
    {% subcaption in a subfloatrow
```

subfigure and subtable environments take width as an argument.

```
        \IfValueTF{#3}%
        {\@nameuse{sub#2}{#3}}%
        {\@nameuse{sub#2}{\linewidth}}%
    }% subcaption in a subfloatrow
    {% subcaption not in subfloatrow
```

figure and table environments do not take a width argument.

```
        \@nameuse{#2}%
    }% subcaption not in subfloatrow
    #6

    #7
```

End the environments:

```
    \ifbool{LWR@insubfloatrow}%
    {\@nameuse{endsub#2}}%
    {\@nameuse{end#2}}%
}% subcaption
{% assume subfig
```

For subfig:

```
\ifbool{LWR@insubfloatrow}%
{% subfig in a subfloatrow
```

\subfloat is a macro, not an environment.

Package subfig's \subfloat command takes an optional argument which is the caption, but \floatbox argument #6 contains commands to create the caption and label, not the caption itself. Thus, \caption is temporarily disabled to return its own argument without braces.

```
    \begingroup

(*Emulates or patches code by* Xavier Danaux.)

Pkg fontawesome fontawesome is patched for use by lwarp.

Hashed inline images are used, as there may not be Unicode support for all icons.

⚠ *poppler* syntax warning If using pdfLaTeX, *poppler* may issue a syntax warning regarding parsing a ligature component. XeLaTeX or LuaLaTeX may be used to avoid this warning.

In the following, the general strategy is to intercept `\symbol` and embed it inside a `lateximage`. These changes are done inside a local group.

For pdfLaTeX, the `alt` tag includes the icon (symbol) number. For XeLaTeX and LuaLaTeX, the `alt` tag is generic.

## § 308.3 Printing HTML styles

`\LWR@rotstyle` {⟨*prefix*⟩} {⟨*degrees*⟩}

Prints the rotate style with the given prefix.

`prefix` is `-ms-` or `-webkit-` or nothing, and is used to generate three versions of the `transform:rotate` style.

```
\newcommand*{\LWR@rotstyle}[2]{%
    \edef\LWR@tempone{#2}%
    \setcounter{LWR@tempcountone}{-1*\real{\LWR@tempone}} % space
    #1transform:rotate(\arabic{LWR@tempcountone}deg); % space
}
```

`\LWR@scalestyle` {⟨*prefix*⟩} {⟨*xscale*⟩} {⟨*yscale*⟩}

Prints the scale style with the given prefix.

`prefix` is `-ms-` or `-webkit-` or nothing, and is used to generate three versions of the `transform:scale` style.

```
\newcommand*{\LWR@scalestyle}[3]{%
    #1transform:scale(#2,#3);
}
```

## § 308.4 `\includegraphics`

`\LWR@opacity` For HTML, used only for `\includegraphics`.

`\LWR@opacity` may be set by the transparent package.

```
\def\LWR@opacity{1}
```

`\LWR@imagesizebox` Used to determine the actual image size if needed.

```
\newsavebox{\LWR@imagesizebox}
```

`\LWR@HTML@Gin@setfile` {⟨*w*⟩} {⟨*h*⟩} {⟨*filename*⟩} Sets the parsed filename for HTML output.

```
\newcommand*{\LWR@HTML@Gin@setfile}[3]{%
    \xdef\LWR@parsedfilename{#3}%

## § 309 Package graphicx

Pkg graphicx graphicx is emulated.

graphicx loads graphics, which also loads lwarp-graphics, which remembers the original graphics definitions for use inside a `latexmage`, and then patches them `\AtBeginDocument` for HTML output.

lwarp-graphics handles the syntax of either graphics or graphicx.

Pkg grffile grffile is supported as-is. File types known to the browser are displayed, and unknown file types are given a link. Each PDF image for print mode should be accompanied by an SVG, PNG, or JPG version for HTML.

⚠ matching PDF and SVG

lwarp-grffile now exists as a placeholder since grffile used to be emulated by lwarp, and thus older versions of lwarp-grffile may exist and should be overwritten by this newer version.

## § 337 Package keyfloat

(*Emulates or patches code by* Brian Dunn.)

Pkg keyfloat keyfloat is supported with a considerable amount of hacking. (It's a mashup of lwarp, keyfloat, and tocdata.)

⚠ keywrap If placing a `\keyfig[H]` inside a `keywrap`, use an absolute width for `\keyfig`, instead of `lw`-proportional widths. (The `[H]` option forces the use of a minipage, which internally adjusts for a virtual 6-inch wide minipage, which then corrupts the `lw` option.)

**for HTML output:**

```
\LWR@ProvidesPackagePass{keyfloat}[2019/09/23]

\@ifpackagelater{keyfloat}{2019/09/23}{\relax}{

# kpfonts

(*Emulates or patches code by* Christophe Caignaert.)

Pkg kpfonts kpfonts is used as-is for SVG math, and is emulated for MathJax.

⚠ limitations The MathJax emulation honors the options uprightRoman for \D only, classicReIm, frenchstyle for Greek only, upright for Greek only, uprightgreeks, slantedGreeks, and mathcalasscript.

The dedicated macros for Greek work correctly.

SVG math should appear the same as the printed output.

# kpfonts-otf

(*Emulates or patches code by* Daniel Flipo.)

Pkg kpfonts-otf

kpfonts-otf is used as-is for SVG math, and is emulated for MathJax.

⚠ limitations

The MathJax emulation honors the options `fancyReIm`, `mathcal`, `frenchstyle` for Greek only, and `mathcalasscript`.

Also see the options for unicode-math, which is loaded by kpfonts-otf.

The unicode-math dedicated macros for Greek work correctly.

⚠ `\mathversion`

The MathJax emulation does not change with the use of `\mathversion`. Whatever emulation is established at the begin of the document will remain.

SVG math should appear the same as the printed output.

## § 348 Package libertinust1math

(*Emulates or patches code by* Michael Sharpe.)

Pkg libertinust1math libertinust1math is used as-is for SVG math, and is emulated for MathJax.

The MathJax emulation honors `frenchmath` for Greek but not Latin characters, and `slantedGreek`, `uprightGreek`, and `ISO` also adjust Greek characters. MathJax cannot yet honor options for adjusting Latin characters.

The dedicated macros for upright and italic Greek letters do work correctly.

Some of the symbol font macros such as `\mathsfbf` do not use a sans font because MathJax does not yet have sans Greek.

SVG math honors all font choices, and should appear the same as the printed output.

## § 351 Package listings

(*Emulates or patches code by* Carsten Heinz, Brooks Moses, Jobst Hoffmann.)

Pkg listings listings is supported with some limitations. Text formatting is not yet supported.

```
1 \LWR@ProvidesPackagePass{listings}[2018/09/02]
```

Force flexible columns. Fixed columns inserts spaces in the PDF output.

```
\lst@column@flexible
```

Patches to embed listings inside `pre` tags:

```
\let\LWR@origlst@Init\lst@Init
\let\LWR@origlst@DeInit\lst@DeInit

\let\LWR@origlsthkEveryPar\lsthk@EveryPar

\renewcommand{\l@lstlisting}[2]{\hypertocfloat{1}{lstlisting}{lol}{#1}{#2}}
```

`\lstset` {⟨*options*⟩}

Use the listings `literate` option to replace HTML entities:

```
\def\lstset@#1{\endgroup%
%  \ifx\@empty#1%
%         \@empty%
%     \else%
        \setkeys{lst}{%
            #1%
            ,literate=%
            {<}{\HTMLentity{lt}}{4}%
            {>}{\HTMLentity{gt}}{4}%
            {'}{\HTMLentity{apos}}{6}%
            {‘}{\HTMLentity{grave}}{7}%
```

The ampersand is not treated here, as the result is inconsistent spacing. It is nevertheless converted to `&` elsewhere. Sanitizing the double quote interferes with listings' conversion of visible spaces inside strings.

```
        }%
%     \fi%
}
```

`\lst@Init` {⟨*backslash-processing*⟩} Done at the start of a listing.

```
\renewcommand{\lst@Init}[1]{%
```

Perform the listings initialization:

```
\LWR@traceinfo{lst@Init}%

File 261 **lwarp-lyluatex.sty**

## § 368 Package lyluatex

(*Emulates or patches code by* Fr. Jacques Peron, Urs Liska, Br. Samuel Springuel.)

Pkg lyluatex lyluatex is patched for use by lwarp.

For the first compile, to set *lwarpmk*'s configuration, use:

```
lualatex --shell-escape <filename>
```

⚠ images After compiling the document with **lwarpmk html**, use **lwarpmk limages** to convert the Lilypond images for HTML.

The option insert=systems results in an image per system. Each music image "system" css is placed inside a  of class lyluatex, which defaults to display: inline-block.

⚠ insert=fullpage The option insert=fullpage results in a single image per page of printed output. Each css music "fullpage" image is placed inside a  of class lyluatex. To match the number of measures per line with the printed version, use the geometry package to select the page geometry, or use the lyluatex options for page and staff sizes.

⚠ options To use \linewidth or \textwidth inside the package options for lyluatex, use the kvoptions-patch package first:

```
\usepackage{kvoptions-patch}
\usepackage[...,line-width-0.8\linewidth,...]{lyluatex}
```

⚠ raw-pdf If using raw-pdf, the resulting PDF images must be converted to SVG:

Enter ⇒ **lwarpmk pdftosvg tmp-ly/*.pdf**

**for HTML output:**

```
\LWR@origRequirePackage{luacode}

\LWR@ProvidesPackagePass{lyluatex}[2019/05/27]
```

User-redefinable ALT tag:

```
\newcommand*{\LyluatexImageAltText}{-lilypond-~\PackageDiagramAltText}
```

\ly@compilescore {⟨*Lilypond object*⟩}

```
\LetLtxMacro\LWR@orig@ly@compilescore\ly@compilescore

\renewcommand*{\ly@compilescore}[1]{%
```

A local group holds a number of changes:

```
    \begingroup%
```

The user's original geometry and font size are restored to match the print version. This allows for correct spacing in the musical score.

```
    \LWR@maybe@orignewpage%
    \LWR@origloadgeometry{LWR@usergeometry}%
    \LWR@print@normalsize%
```

A local group holds a redefined \includegraphics which is used by *lyluatex.lua* to insert the *Lilypond* score if insert=systems is used. This is now placed inside a lateximage, which itself is placed inside a  of class lyluatex.

\LWR@addbaselinemarker preserves the left margins.

```
    \renewcommand{\includegraphics}[2][]{%
        \InlineClass{lyluatex}{%
            \begin{lateximage}[\LyluatexImageAltText]%
            \LWR@addbaselinemarker%
            \LWR@origincludegraphics{##2}%
```

**for HTML output:**

```
\LWR@ProvidesPackagePass{makeidx}[2014/09/29]
```

`\@wrindex` is redefined `\AtBeginDocument` by the lwarp core.

`\printindex`

```

```

File 264 **lwarp-manyfoot.sty**

## § 371 Package manyfoot

Pkg manyfoot manyfoot is emulated.

bigfoot, manyfoot

⚠ verbatim

Verbatim footnotes are not yet supported.

If using the bigfoot package, and possibly also manyfoot, problems may occur with counter allocation because lwarp uses many counters, and there is a difference in how counters numbered 256 and up are handled in pdfLaTeX. With bigfoot this has been known to show up as an error related to one footnote insert being forbidden inside another. Another problem showed up as a input stack error, and which of these problems occurred depended on how many counters were allocated.

As a possible solution, try creating several new counters before defining bigfoot or manyfoot footnotes, hoping to shift the problematic counter above the 256 threshold. It may instead be necessary to use XeLaTeX or LuaLaTeX instead of pdfLaTeX.

lwarp's emulation of bigfoot uses manyfoot, so some of the bigfoot enhancements are included here.

The bigfoot "default" footnote is ignored, using the lwarp version instead.

## § 383 Package mathpazo

(*Emulates or patches code by* Walter Schmidt.)

Pkg mathpazo mathpazo is used as-is for SVG math, and is emulated for MathJax.

⚠ limitations The MathJax emulation ignores all package options. The dedicated macros for upright greek letters do work correctly.

SVG math should appear the same as the printed output.

**for HTML output:**

## § 389 Package mcaption

(*Emulates or patches code by* Stephan Hennig.)

Pkg mcaption mcaption is ignored.

**for HTML output:** Discard all options for lwarp-mcaption:

```
\LWR@ProvidesPackageDrop{mcaption}[2009/03/13]

\newenvironment{margincap}{}{}
\newcommand*{\margincapalign}{}
\newlength{\margincapsep}
```

File 283 **lwarp-mdframed.sty**

## § 390 Package mdframed

(*Emulates or patches code by* Marco Daniel, Elke Schubert.)

Pkg mdframed mdframed is loaded with options forced to `frame method=none`.

## § 390.1 Limitations

support Most basic functionality is supported, including frame background colors and single-border colors and thickness, title and subtitle background colors and borders and thickness, border radius, and shadow. CSS classes are created for mdframed environments and frame titles.

⚠ loading When used, lwarp loads mdframed in HTML with `framemethod=none`.

font For title font, use

```
frametitlefont=\textbf,
```

instead of

```
frametitlefont=\bfseries,
```

where `\textbf` must appear just before the comma and will receive the following text as its argument (since the text happens to be between braces in the mdframed source). Since lwarp does not support `\bfseries` and friends, only one font selection may be made at a time.

theoremtitlefont `theoremtitlefont` is not supported, since the following text is not in braces in the mdframed source.

ignored options `userdefinedwidth` and `align` are currently ignored.

css classes Environments created or encapsulated by mdframed are enclosed in a `<div>` of class `mdframed`, and also class `md<environmentname>` for new environments.

Frame titles are placed in a `<div>` of class |mdframedtitle|. Subtitles are in a `<div>` of class |mdframedsubtitle|, and likewise for subsubtitles.

Pre-existing hooks are used to patch extra functions before and after the frames.

## § 390.2 Package loading

**for HTML output:**

```
\RequirePackage{xcolor}% for \convertcolorspec

\LWR@ProvidesPackageDrop{mdframed}[2013/07/01]
```

Do not require Ti*k*z or pstricks:

```
\LWR@origRequirePackage[framemethod=none]{mdframed}
```

## § 390.3 Patches

Patch to remove PDF formatting and add HTML tags:

```
\AtBeginDocument{
\def\mdf@trivlist#1{%
  \edef\mdf@temp{%
%     \topsep=\the\topsep\relax%
%     \partopsep=\the\partopsep\relax%
%     \parsep=\the\parsep\relax%
  }%
%   \setlength{\topsep}{#1}%
```

```
%   \topskip\z@%
%   \partopsep\z@%
%   \parsep\z@%
%   \@nmbrlistfalse%
%   \@trivlist%
%   \labelwidth\z@%
%   \leftmargin\z@%
%   \itemindent\z@%
  \let\@itemlabel\@empty%
  \def\makelabel##1{##1}%
%   \item\relax\mdf@temp\relax%
}

\renewcommand*{\endmdf@trivlist}{%
\LWR@traceinfo{endmdf@trivlist}%
% \endtrivlist%
\LWR@listend%
}
}% AtBeginDocument
```

## § 390.4 Initial setup

To handle css and paragraphs, patch code at start and end of environment and contents. `\LWR@print@raggedright` helps avoid hyphenation.

```
\mdfsetup{
startcode={\LWR@mdframedstart\LWR@print@raggedright},
endcode={\LWR@mdframedend},
startinnercode={\LWR@startpars\LWR@print@raggedright},
endinnercode={\LWR@stoppars},
}
```

## § 390.5 Color and length HTML conversion

`\LWR@mdfprintcolor` {⟨*mdfcolorkey*⟩}

Given the mdframed key, print the color.

```
\newcommand*{\LWR@mdfprintcolor}[1]{%
\convertcolorspec{named}{\@nameuse{mdf@#1}}{HTML}\LWR@tempcolor%
\LWR@origpound\LWR@tempcolor
}
```

`\LWR@mdfprintlength` {⟨*mdflengthkey*⟩}

Given the mdframed key, print the length.

```
\newcommand*{\LWR@mdfprintlength}[1]{%
\LWR@forceminwidth{\@nameuse{mdf@#1@length}}%
\LWR@printlength{\LWR@atleastonept}%
}
```

## § 390.6 Environment encapsulation

\LWR@mdframedstart Actions before an mdframe starts.

Encapsulate a frame inside a  of the desired class.

```
\newcommand*{\LWR@mdframedstart}{%
\LWR@traceinfo{LWR@mdframedstart start}%
```

Warn if starting a frame inside a :

```
    \LWR@spanwarninvalid{mdframe}%
```

Turn off paragraph handling during the generation of the encapsulating tags:

```
\LWR@stoppars%
```

Open a  and with custom class and custom style. A BlockClass environment is not used because this  is created by the mdframed startcode and endcode settings, which do not properly nest the  inside the mdframed environment.

```
\LWR@htmltagc{div class=\textquotedbl%
mdframed%
\ifdefstring{\LWR@mdthisenv}{mdframed}{}{ \LWR@mdthisenv}%
\textquotedbl \LWR@orignewline
style=\textquotedbl\LWR@orignewline
```

Convert and print the background color:

```
background: \LWR@mdfprintcolor{backgroundcolor} ; \LWR@orignewline
```

Convert and print the border color and width:

```
border: \LWR@mdfprintlength{linewidth} solid
\LWR@mdfprintcolor{linecolor} ; \LWR@orignewline
```

Convert and print the border radius:

```
border-radius: \LWR@mdfprintlength{roundcorner} ; \LWR@orignewline
```

Convert and print the shadow:

```
\ifbool{mdf@shadow}{%
    box-shadow:
    \LWR@mdfprintlength{shadowsize}
    \LWR@mdfprintlength{shadowsize}
    \LWR@mdfprintlength{shadowsize}
    \LWR@mdfprintcolor{shadowcolor} ;
}
{box-shadow: none ;}
\LWR@orignewline

\textquotedbl}
% \LWR@htmldivclass{\LWR@mdthisenv}
```

mdframed environment may not work with the HTML versions of the following, so restore them to their originals while inside mdframed:

```
\LWR@select@print@hspace%
\renewcommand*{\rule}{\LWR@print@rule}
\LetLtxMacro\makebox\LWR@print@makebox%

\LWR@startpars%
\LWR@traceinfo{LWR@mdframedstart done}%
}
```

\LWR@mdframedend Actions after an mdframe ends.

After closing the , globally restore to the default environment type:

```
\newcommand*{\LWR@mdframedend}{
\LWR@traceinfo{LWR@mdframedend start}%
```

Close the custom :

```
\LWR@htmldivclassend{\LWR@mdthisenv}
```

Reset future custom class to the default:

```
\gdef\LWR@mdthisenv{mdframed}
```

Resume paragraph handling:

```
\LWR@startpars%
\LWR@traceinfo{LWR@mdframedend done}%
}
```

§ 392 Package

# media9

Pkg media9 media9 is emulated.

The packages multimedia, movie15, and media9 are supported.

HTML5 <audio> and <video> objects are created for .mp3 and .mp4 files.

HTML5 <embed> objects are created for http and ftp links.

\href links are created for other media types. (Unfortunately, there is not much overlap between the file types supported for print output and the file types supported by HTML5.)

For media9, a multimedia object is inserted for each addresource=, as well as each flashvars source= and src=. This may result in duplicate objects.

Undesired objects may be nullified by placing them inside \warpprintonly or the warpprint environment.

Each HTML multimedia object includes the poster text, except for <embed> objects. For movie15, the text option is supported to specify the poster text.

The width, height, and totalheight options are supported. The HTML object is scaled according to the display width, correctly compensating for either tall or wide viewports.

Other options are ignored.

media9 \addmediapath is supported. It is assumed that the same path structure will exist for the HTML document.

HTML5 media controls are always specified for each <audio> and <video> object.

media9 slideshows are not supported.

\hyperlinkmovie, \movieref, and \mediabutton are not supported.

3D objects are not supported.

If using a YouTube™ video, use an "embedded" URL with .../embed/... instead of .../v/...

⚠ & in a URL Many special characters are converted to regular catcode 12 characters for use inside a URL. & is used in the flash variables fields, which are split with xparse \SplitList, which does not seem to work with a catcode 12 divider token, so & is not converted to catcode 12, and will not work in a URL with media9. Using & in a URL in a flashvars field may also cause parsing problems with print output, as well.

**for HTML output:**

```
\LWR@ProvidesPackageDrop{media9}[2019/02/21]

# § 404 Package mismath

(*Emulates or patches code by* Antoine Missier.)

Pkg mismath mismath is patched for SVG math, and emulated for MathJax.

⚠ MathJax `\enumber`, `\inumber`, `\jnumber`, and `\pinumber` are ignored for MathJax, except that `\itpi` is made available as a clone of `\pi`.

For MathJax, `\boldvect` and `\arrowvect` are honored if in the preamble.

If `\boldvectcommand` is set to `\mathbf` in the preamble, it will be used for MathJax, otherwise it will default to `\mathit`. `\boldvectcommand` may also be set with `\CustomizeMathJax` in the preamble. See section 8.7.5. Note that as of this writing there is not a bold italic font across all MathJax fonts.

If `\probastyle` is set to `\mathbb` in the preamble, it will be used for MathJax, otherwise it will default to `\mathrm`. `\probastyle` may be set with `\CustomizeMathJax` in the preamble.

If `\mathset` is set to `\mathbb` in the preamble, it will be used for MathJax, otherwise it will default to `\mathbf`. `\mathset` may be set with `\CustomizeMathJax` in the preamble.

**for HTML output:**

File 301 **lwarp-movie15.sty**

## § 408 Package movie15

Pkg movie15 movie15 is emualted.

The packages multimedia, movie15, and media9 are supported.

HTML5 <audio> and <video> objects are created for .mp3 and .mp4 files.

HTML5 <embed> objects are created for http and ftp links.

\href links are created for other media types. (Unfortunately, there is not much overlap between the file types supported for print output and the file types supported by HTML5.)

For media9, a multimedia object is inserted for each addresource=, as well as each flashvars source= and src=. This may result in duplicate objects.

Undesired objects may be nullified by placing them inside \warpprintonly or the warpprint environment.

Each HTML multimedia object includes the poster text, except for <embed> objects. For movie15, the text option is supported to specify the poster text.

The width, height, and totalheight options are supported. The HTML object is scaled according to the display width, correctly compensating for either tall or wide viewports.

Other options are ignored.

media9 \addmediapath is supported. It is assumed that the same path structure will exist for the HTML document.

HTML5 media controls are always specified for each <audio> and <video> object.

media9 slideshows are not supported.

\hyperlinkmovie, \movieref, and \mediabutton are not supported.

3D objects are not supported.

If using a YouTube™ video, use an "embedded" URL with .../embed/... instead of .../v/...

. . . &  \multirow{2}{.5in}{text}  & . . .
. . . &  \mrowcell                 & . . .
```

colored cells

- The multirow documentation regarding colored cells recommends using a negative number of rows. This will not work with lwarp, so `\warpprintonly` and `\warpHTMLonly` must be used to make versions for print and HTML.

with \multicolumn

- See section 416.2 for `\multicolumrow`.

⚠ \multicolumn & \multirow

lwarp does not support directly combining `\multicolumn` and `\multirow`. Use `\multicolumnrow` instead. To create a 2 column, 3 row cell:

```
\multicolumnrow{2}{c}[c]{3}[0]{1in}[0pt]{Text}
```

The two arguments for `\multicolumn` come first, followed by the five arguments for `\multirow`, many of which are optional, followed by the contents.

⚠ skipped cells

⚠ empty cells

As per `\multirow`, skipped cells to the right of the `\multicolumnrow` statement are not included in the source code on the same line. On the following lines, `\mcolrowcell` must be used for each cell of each column and each row to be skipped. An error is generated if this is missed.

```
. . . &  \multicolumnrow{2}{c}[c]{3}[0]{1in}[0pt]{Text}  & . . .
. . . &  \mcolrowcell          &          \mcolrowcell   & . . .
. . . &  \mcolrowcell          &          \mcolrowcell   & . . .
```

⚠ MathJax

- MathJax does not support multirow, so it is emulated to only print its text on the first row. `\multirow` works as expected in text `tabulars` or SVG math.

In a `lateximage`, the print versions are restored.

See section 74.25 for the print-mode versions.

**for HTML output:** Remove the placeholder macro which was used if multirow was not loaded:

```
\LetLtxMacro\multirow\relax
\LWR@ProvidesPackagePass{multirow}[2021/01/29]
```

`\LWR@multirowborder` Set to `left` or `right` to create a thick border for the cell, for use by bigdelim:

```
\newcommand{\LWR@multirowborder}{}
```

## § 416.1 Multirow

```

The column's < spec:

```

While printing the text, redefine \\ to generate a new line. If a nested `tabular` occurs, \\ is redefined to `\LWR@tabularendofline` at the start of the `tabular`, then `\LWR@endofline` before again printing any `\multirow` contents inside the nested `tabular`.

\par is redefined to insert an HTML break, and if `tabular` is nested, it is redefined at the start of `tabular`.

## § 418 Package musicography

(*Emulates or patches code by* Andrew A. Cashner.)

Pkg musicography musicography is patched for use by lwarp.

Images are used for the meter symbols and fingered bass, since the HTML fonts tend not to be the correct size and HTML cannot stack items. The HTML `alt` tag copies `C` and `3/2`, etc. Hashes are used for the meter images, which are then reused as necessary.

⚠ Note that browser support for musical symbols may be buggy. ALT text and copy/paste into a text editor work well.

§ 428 Package

# newtxsf

(*Emulates or patches code by* Michael Sharpe.)

Pkg newtxsf newtxsf is used as-is for SVG math, and is emulated for MathJax.

⚠ limitations The MathJax emulation ignores all package options, except slantedGreek is honored. The dedicated macros for upright and italic Greek and bold italic Latin letters do work correctly.

SVG math should appear the same as the printed output.

**for HTML output:**

## § 430 Package nfssext-cfr

(*Emulates or patches code by* Clea F. Rees.)

Pkg nfssext-cfr nfssext-cfr is emulated in HTML, and used as-is in print output.

Results depend on the browser's font.

## § 433 Package nicematrix

(*Emulates or patches code by* F. Pantigny.)

Pkg nicematrix nicematrix is used as-is for SVG math, and is emulated for MathJax.

⚠ MathJax Keys/values are ignored in MathJax. `\Cdots`, etc. do not span multiple cells. `AutoNiceMatrix`, etc. are not supported for MathJax. SVG math output preserves all nicematrix features. To force SVG output for one or more consecutive math expressions, for inline math use `\inlinemathother` and `\inlinemathnormal`, or for display math use `\displaymathother` and `\displaymathnormal`.

**for HTML output:**

```
\LWR@ProvidesPackagePass{nicematrix}[2020/11/23]
```

`NiceTabular` must be converted to SVG to support the various nicematrix options:

```
\begin{warpHTML}
\BeforeBeginEnvironment{NiceTabular}{%
    \begin{lateximage}[-nicematrix-~\PackageDiagramAltText]%
}
\AfterEndEnvironment{NiceTabular}{\end{lateximage}}
\BeforeBeginEnvironment{NiceTabular*}{%
    \begin{lateximage}[-nicematrix-~\PackageDiagramAltText]%
```

```
}
\AfterEndEnvironment{NiceTabular*}{\end{lateximage}}
\end{warpHTML}
```

Special handling for the optional arguments, and the lack of a delimiter:

```
\begin{warpMathJax}
\CustomizeMathJax{\newcommand{\LWRnicearrayarray}[1]{\begin{array}{#1}}}
\CustomizeMathJax{\def\LWRnicearrayarrayopt#1[#2] {\begin{array}{#1}}}

\CustomizeMathJax{%
    \newenvironment{NiceArray}[2][]%
        {\ifnextchar[{\LWRnicearrayarrayopt{#2}}{\LWRnicearrayarray{#2}}}%
        {\end{array}}%
}

\CustomizeMathJax{%
    \newcommand{\LWRnicearraywithdelimtwo}[2][]{%
        \ifnextchar[{\LWRnicearrayarrayopt{#2}}{\LWRnicearrayarray{#2}}%
    }%
}
```

General case with left/right delimiters:

```
\CustomizeMathJax{%
    \newenvironment{NiceArrayWithDelims}[2]%
        {%
            \def\LWRnicearrayrightdelim{\right#2}%
            \left#1%
            \LWRnicearraywithdelimtwo%
        }%
        {\end{array}\LWRnicearrayrightdelim}%
}
```

Instances of specific delimiters:

```
\CustomizeMathJax{%
    \newenvironment{pNiceArray}
        {\begin{NiceArrayWithDelims}{(}{)}}
        {\end{NiceArrayWithDelims}}
}

\CustomizeMathJax{%
    \newenvironment{bNiceArray}
        {\begin{NiceArrayWithDelims}{[}{]}}
        {\end{NiceArrayWithDelims}}
}

\CustomizeMathJax{%
    \newenvironment{BNiceArray}
        {\begin{NiceArrayWithDelims}{\{}{\}}}
        {\end{NiceArrayWithDelims}}
}

\CustomizeMathJax{%
```

```
    \newenvironment{vNiceArray}
        {\begin{NiceArrayWithDelims}{\vert}{\vert}}
        {\end{NiceArrayWithDelims}}
}

\CustomizeMathJax{%
    \newenvironment{VNiceArray}
        {\begin{NiceArrayWithDelims}{\Vert}{\Vert}}
        {\end{NiceArrayWithDelims}}
}
```

Ignore optional arg and use standard environments:

```
\CustomizeMathJax{\newenvironment{NiceMatrix}[1][]{\begin{matrix}}{\end{matrix}}}
\CustomizeMathJax{\newenvironment{pNiceMatrix}[1][]{\begin{pmatrix}}{\end{pmatrix}}}
\CustomizeMathJax{\newenvironment{bNiceMatrix}[1][]{\begin{bmatrix}}{\end{bmatrix}}}
\CustomizeMathJax{\newenvironment{BNiceMatrix}[1][]{\begin{Bmatrix}}{\end{Bmatrix}}}
\CustomizeMathJax{\newenvironment{vNiceMatrix}[1][]{\begin{vmatrix}}{\end{vmatrix}}}
\CustomizeMathJax{\newenvironment{VNiceMatrix}[1][]{\begin{Vmatrix}}{\end{Vmatrix}}}
```

Ignore optional argument and size. Print contents.

```
\CustomizeMathJax{\newcommand{\LWRnicematrixBlock}[1]{#1}}
\CustomizeMathJax{\def\LWRnicematrixBlockopt<#1>#2{#2}}

\CustomizeMathJax{%
   \newcommand{\Block}[2][]{\ifnextchar<\LWRnicematrixBlockopt\LWRnicematrixBlock}%
}
```

Form an approximation:

```
\CustomizeMathJax{%
    \newcommand{\diagbox}[2]{%
        \begin{array}{l}\hfill\quad#2\\\hline#1\quad\hfill\end{array}%
    }%
}
```

More approximations:

```
\CustomizeMathJax{\let\hdottedline\hdashline}

\CustomizeMathJax{\newcommand{\ldots}[1][]{\dots}}
\CustomizeMathJax{\newcommand{\Cdots}[1][]{\cdots}}
\CustomizeMathJax{\newcommand{\Vdots}[1][]{\vdots}}
\CustomizeMathJax{\newcommand{\Ddots}[1][]{\ddots}}
\CustomizeMathJax{\newcommand{\Iddots}[1][]{\mathinner{\unicode{x22F0}}}}

\CustomizeMathJax{\newcommand{\Hdotsfor}[1]{\ldots}}
\CustomizeMathJax{\newcommand{\Vdotsfor}[1]{\vdots}}
```

There is no way to emulate `AutoNiceMatrix` in MathJax.

```
\CustomizeMathJax{\newcommand{\AutoNiceMatrix}[2]{\text{(AutoNiceMatrix #1)}}}
\CustomizeMathJax{\let\pAutoNiceMatrix\AutoNiceMatrix}
\CustomizeMathJax{\let\bAutoNiceMatrix\AutoNiceMatrix}
```

```
\CustomizeMathJax{\let\BAutoNiceMatrix\AutoNiceMatrix}
\CustomizeMathJax{\let\vAutoNiceMatrix\AutoNiceMatrix}
\CustomizeMathJax{\let\VAutoNiceMatrix\AutoNiceMatrix}
\end{warpMathJax}
```

Table 18: Ntheorem package — css styling of theorems and proofs

**Theorem:**  of class theorembody<theoremstyle>

**Theorem Header:**  of class theoremheader<style>

where <theoremstyle> is plain, break, etc.

### § 443.1 Limitations

⚠ Font control This conversion is not total. Font control is via css, and the custom LaTeX font settings are ignored.

⚠ cref reference format undefined If the print version does not use cleveref, place all \theoremstyle and \newtheorem declarations in the preamble inside \AtBeginDocument.[19] For some theorems, it may also be required to add inside \AtBeginDocument something such as:

[19] lwarp uses cleveref for the HTML conversion, and loads cleveref \AtEndPreamble, just before \AtBeginDocument.

```
\AtBeginDocument{ % if not using cleveref package
  \theoremstyle{definition}
  \newtheorem{dtheorem}{Definition}
  . . .
  \usepackage{etoolbox} % for \ifdef
  \ifdef{\cref}{
    \crefname{Proof}{Proof}{Proofs}
  }{}
}
```

⚠ Equation numbering

ntheorem has a bug with equation numbering in $\mathcal{AMS}$ environments when the option `thref` is used. lwarp does not share this bug, so equations with `\split`, etc, are numbered correctly with lwarp's HTML output, but not with the print output. It is recommended to use cleveref instead of ntheorem's `thref` option.

§ 443.2

## Options

Options `amsthm` or `standard` choose which set of theorems and proofs to initialize.

⚠ Disabled options

The options `thmmarks` and `amsmath` are disabled, since they heavily modify the underlying math code. Theorem marks are emulated. The AMS-math modifications are not done.

Option `thref` is disabled because cleveref functions are used instead. `\thref` is emulated.

Option `hyperref` is disabled because lwarp emulated hyperref.

**for HTML output:**

Some disabled options:

```
\DeclareOption{thref}{
    \AtEndDocument{
        \PackageWarningNoLine{lwarp}{%
            Lwarp uses cleveref, which takes over ntheorem's\MessageBreak
            referencing, including
                \protect\label \space and \protect\thref.\MessageBreak
            Cleveref does not accept ntheorem's optional\MessageBreak
            argument for \protect\label, so it will appear\MessageBreak
            in the text.  It is recommended to remove the\MessageBreak
            thref option, \protect\usepackage{cleveref} instead,\MessageBreak
            and remove any trailing optional arguments for \protect\label%
        }%
    }
}

\newbool{LWR@ntheoremmarks}
\boolfalse{LWR@ntheoremmarks}

\DeclareOption{thmmarks}{
\booltrue{LWR@ntheoremmarks}
\newif\ifsetendmark\setendmarktrue
}

\newbool{LWR@ntheoremamsthm}
\boolfalse{LWR@ntheoremamsthm}

```

```

\DeclareOption{amsmath}{}
\DeclareOption{hyperref}{}

\renewcommand{\@endtheorem}{%

```

## § 443.11 \NoEndMark

```
\gdef\NoEndMark{\global\setendmarkfalse}
```

## § 443.12 List-of

Redefined to reuse the float mechanism to add list-of-theorem links:

`\thm@thmline` {⟨*1: printed type*⟩} {⟨*2: #*⟩} {⟨*3: optional*⟩} {⟨*4: page*⟩}

```
\renewcommand{\thm@@thmline@noname}[4]{%
\hypertocfloat{1}{theorem}{thm}{#2 #3}{}%
}

\renewcommand{\thm@@thmline@name}[4]{%
\hypertocfloat{1}{theorem}{thm}{#1 #2 #3}{}%
}
```

This was redefined by ntheorem when loaded, so it is now redefined for lwarp:

```
\def\thm@@thmline{\thm@@thmline@name}
```

Patch for css:

```
\def\listtheorems#1{
\LWR@htmlelementclass{nav}{lothm}%
\begingroup
\c@tocdepth=-2%
\def\thm@list{#1}\thm@processlist
\endgroup
\LWR@htmlelementclassend{nav}{lothm}%
}
```

# § 445 Package overpic

(*Emulates or patches code by* Rolf Niepraschk.)

Pkg overpic overpic is patched for use by lwarp.

⚠ scaling The macros \overpicfontsize and \overpicfontskip are used during HTML generation. These are sent to \fontsize to adjust the font size for scaling differences between the print and HTML versions of the document. Renew these macros before using the overpic and Overpic environments.

See section 87.2 for the print-mode version of \overpicfontsize and \overpicfontskip.

**for HTML output:**

```
\LWR@ProvidesPackagePass{overpic}[2017/10/06]

\newcommand*{\overpicfontsize}{12}

rulebetween is honored. The other keys are ignored, including colwidths.

# pdfrender

Pkg pdfrender pdfrender is allowed during HTML, but it has no effect on HTML text output. pdfrender is enabled for use with xfakebold, and it is enabled during HTML so that it may be in use when an SVG math image is started. I.e. xfakebold's \setBold may be used outside of a math expression and still be detected when the math begins.

The lwarp-pdfrender package is present because it used to disable pdfrender, so this newer version is to overwrite older versions.

⚠ convert image files The pdftricks image files <jobname>-fig*.pdf must be converted to .svg, or else a missing file error will occur. The image files must also be converted again whenever they change. To convert the images:

File 363 **lwarp-perpage.sty**

## § 470 Package perpage

(*Emulates or patches code by* David Kastrup.)

Pkg perpage perpage is mostly ignored, but support is added for footnote counters.

There is no page number in HTML, so most counters are not reset. If the document redefines \the<countername> to include \theperpage, it is necessary to place that redefininition inside a warpprint environment to avoid modifying the HTML defintions.

\AddAbsoluteCounter must not be inside warpprint, as the counter must be added for HTML also, although it is not incremented.

footnote numbering

To have footnote numbers reset each time footnotes are printed:

```
\setcounter{footnoteReset}{1}
```

For bigfoot, manyfoot, or perpage:

```
\MakePerPage{footnoteX}
— or —
\MakeSortedPerPage{footnoteX}
```

The footnotes are reset when they are printed, according to section level as set by `FootnoteDepth`, which is not necessarily by HTML page. This is recommended for `\alph`, `\Alph`, or `\fnsymbol` footnotes, due to the limited number of symbols which are available.

**for HTML output:**

```
\LWR@ProvidesPackageDrop{perpage}[2014/10/25]

\newcommand\AddAbsoluteCounter[1]

§ 503 Package

# relsize

(*Emulates or patches code by* Donald Arseneau, Bernie Cosell, Matt Swift.)

Pkg relsize relsize is patched for use by lwarp, and emulated for MathJax.

For HTML, only the inline macros are supported: \textlarger, \textsmaller, and \textscale. Each becomes an inline span of a modified font-size.

\relsize, \larger, \smaller, and \relscale are ignored.

While creating SVG math for HTML, the original definitions are temporarilty restored, and so should work as expected.

⚠ not small The HTML browser's setting for minumum font size may limit how small the output will be displayed.

"placement" is ignored.

```
5 \RenewDocumentCommand{\newfloat}{m m m o}{%

newfloat package automatically creates the `\listof` command for new floats, but float does not, so remove `\listof` here in case it is manually created later:

\cslet{listofsideways#1s}\relax%
\cslet{listofsideways#1es}\relax%

File 424 **lwarp-seqsplit.sty**

§ 531 Package

# seqsplit

(*Emulates or patches code by* Boris Veytsman.)

Pkg seqsplit seqsplit is patched for use by lwarp.

For HTML output, the results are similar to print mode, and respond to window size.

⚠ SVG math results For SVG math, the output differs from print mode in that the contents are formatted in a minipage, which is then inline with the surrounding math.

For MathJax, the contents are used as-is.

**for HTML output:**

```
\LWR@ProvidesPackagePass{seqsplit}[2006/08/07]
```

Special handling because lwarp uses a box for SVG math, which does not normally allow line breaks, so a print-mode `minipage` must be used to allow line breaks. The `minipage` will not be wrapped inline with any surrounding math.

```
\begin{warpHTML}
\LetLtxMacro\LWR@orig@seqsplit\seqsplit

\renewcommand*{\seqsplit}[1]{%
    \ifmmode%
        \begin{LWR@print@minipage}{6in}%
```

```
        \LWR@orig@seqsplit{#1}%
        \end{LWR@print@minipage}%
    \else%
        \InlineClass[word-wrap:break-word]{seqsplit}{\LWR@orig@seqsplit{#1}}%
    \fi
}
```

Between characters, an empty HTML comment is placed to allow a line wrap in the HTML source, without adding spaces in the output.

```
\AtBeginDocument{
    \newcommand*{\LWR@HTML@seqinsert}{%
        \LWR@htmlcomment{ }%
    }
    \LWR@formatted{seqinsert}
}

## § 533 Package shadethm

(*Emulates or patches code by* Jim Hefferon.)

Pkg shadethm shadethm is patched for use by lwarp.

**for HTML output:**

```
\LWR@ProvidesPackagePass{shadethm}[1999/11/23]

\newenvironment{LWR@HTML@shadebox}

File 427 **lwarp-shadow.sty**

## § 534 Package shadow

(*Emulates or patches code by* Mauro Orlandini.)

Pkg shadow shadow is emulated.

**for HTML output:** Discard all options for lwarp-shadow:

```
\LWR@ProvidesPackageDrop{shadow}[2003/02/19]

\newdimen\sboxsep
\newdimen\sboxrule
\newdimen\sdim

File 428 **lwarp-shapepar.sty**

## § 535 Package shapepar

(*Emulates or patches code by* Donald Arseneau.)

Pkg shapepar shapepar is patched for use by lwarp. Shapes appear in print mode, as well as inside a `latexmage`, but are ignored for HTML.

**for HTML output:**

```
\LWR@ProvidesPackagePass{shapepar}[2013/03/26]

\newcommand*{\LWR@HTML@shapepar}[2][]{}
\LWR@formatted{shapepar}

\NewDocumentCommand{\LWR@HTML@cutout}{m d()}{}
\LWR@formatted{cutout}
```

---

File 429 **lwarp-showidx.sty**

## § 536 Package showidx

Pkg showidx showidx is ignored.

**for HTML output:** Discard all options for lwarp-showidx:

```
\LWR@ProvidesPackageDrop{showidx}[2014/09/29]
```

`\@wrindex` is redefined `\AtBeginDocument` by the lwarp core.

---

File 430 **lwarp-showkeys.sty**

## § 537 Package showkeys

(*Emulates or patches code by* David Carlisle, Morten Høgholm.)

Pkg showkeys showkeys is ignored.

**for HTML output:** Discard all options for lwarp-showkeys:

```
\LWR@ProvidesPackageDrop{showkeys}[2014/10/28]
\NewDocumentCommand{\showkeys}{s}{}
```

---

File 431 **lwarp-showtags.sty**

§ 538 Package

# showtags

Pkg showtags showtags is ignored.

**for HTML output:**

```
\LWR@ProvidesPackageDrop{showtags}% no version is given
\newcommand{\thecitetag}[1]{}
```

---

File 432 **lwarp-shuffle.sty**

§ 539 Package

# shuffle

(*Emulates or patches code by* Julian Gilbey and Antoine Lejay.)

Pkg shuffle shuffle is emulated for SVG math, and also emulated for MathJax.

The font used for shuffle may not render correctly when converted to SVG math, so a `picture` environment drawing is used instead.

For MathJax, the Unicode character is used, and for `\cshuffle` a `\bar` is added.

**for HTML output:**

```
\LWR@ProvidesPackageDrop{shuffle}[2008/10/27]
\LWR@origRequirePackage{lwarp-common-mathjax-overlaysymbols}

\newcommand*{\LWR@shuffle@start}{%
    \hspace*{.2em}

    \put(0,0){\line(1,0){.75}}
    \put(0,0){\line(0,1){.5}}
    \put(.375,0){\line(0,1){.5}}
    \put(.75,0){\line(0,1){.5}}
}

\newcommand*{\LWR@shuffle@finish}{%
    \end{picture}
    \hspace*{.75em}
    \hspace*{.2em}
}

\newcommand*{\shuffle}{%

```
    \LWR@shuffle@finish%
}

\newcommand*{\cshuffle}{%

    \LWR@shuffle@finish%
}

\begin{warpMathJax}

\end{warpMathJax}
```

File 433 **lwarp-sidecap.sty**

§ 540 Package

# sidecap

(*Emulates or patches code by* Rolf Niepraschk, Hubert Gässlein.)

Pkg sidecap sidecap is emulated.

**for HTML output:** Discard all options for lwarp-sidecap.

```
\LWR@ProvidesPackageDrop{sidecap}[2003/06/06]
```

  {\end{KFLTsidenotes@marginfloat}}

\RenewDocumentEnvironment{margintable}{o}
  {\begin{KFLTsidenotes@marginfloat}{table}}
  {\end{KFLTsidenotes@marginfloat}}
```

The following were changed by sidenotes, and now are reset back to their lwarp-supported originals:

Restoring the definition from the LaTeX $2_\varepsilon$ `article.cls` source:

```
\renewenvironment{figure*}
               {\@dblfloat{figure}}
               {\end@dblfloat}

\renewenvironment{table*}
               {\@dblfloat{table}}
               {\end@dblfloat}
```

For MathJax:

⚠ Note that sidenotes does not support `\sidenote` inside math in print mode. Use `\sidenotemark` and `\sidenotetext` instead.

```
\begin{warpMathJax}
\providecommand{\sidenotename}{sidenote}
\appto\LWR@syncnotenumbers{\LWR@synconenotenumber{LWRsidenote}{\thesidenote}}
\appto\LWR@syncnotenames{\LWR@synconenotename{LWRsidenote}{\sidenotename}}
\CustomizeMathJax{\def\LWRsidenote{1}}
\CustomizeMathJax{\newcommand{\sidenotemark}[1][\LWRsidenote]{{}^{\mathrm{#1}}}}
\end{warpMathJax}
```

The following is not defined since is not allowed inside math in print mode, and also would have to be modified to parse the optional offset argument:

```
\CustomizeMathJax{\newcommand{\sidenote}[2][\LWRsidenote]{{}^{\mathrm{#1}}}}
```

§ 544 Package

# siunitx

(*Emulates or patches code by* Joseph Wright.)

Pkg siunitx

siunitx is patched for use by lwarp, and is emulated for MathJax.

fractions

Due to *pdftotext* limitations, fraction output is replaced by symbol output for `per-mode` and `quotient-mode`.

⚠ math mode required

Some units will require that the expression be placed inside math mode.

⚠ tabular

Tabular `S` columns are rendered as simple `c` columns, and tabular `s` columns are not supported. These may be replaced by `c` columns with each cell contained in `\num` or `\si`.

⚠ MathJax

For math mode with SVG display, the original siunitx code is used while generating the SVG image. For text mode, lwarp uses an emulation which provides a very effective HTML interpretation of siunitx. For math expressions while using MathJax, a limited emulation is used. Most functions work reasonably well, but many options cannot be emulated. Complicated parsing such as for `\ang` is not supported. The result usually looks fine, and otherwise is enough to get the meaning across.

Document modifications required for MathJax:

custom units

- Custom units may be added with `\CustomizeMathJax`. See the lwarp-siunitx code

for examples.

⚠ unit spacing

- Units work better using ~ between units instead of using periods.

⚠ \square, \cubic

- To square or cube compound units, enclose the following compound units in braces:

  ```
  \cubic{\centi\meter}
  ```

  Single units do not require braces.

Also see MathJax option, section 8.7.4.

**for HTML output:**

```
\RequirePackage{xcolor}% for \convertcolorspec

\LWR@ProvidesPackagePass{siunitx}[2018/05/17]

\AtBeginDocument{% in case textcomp was not loaded
\DeclareSIUnit\bohr{\textit{a}\textsubscript{0}}
\DeclareSIUnit\clight{\textit{c}\textsubscript{0}}
\DeclareSIUnit\elementarycharge{\textit{e}}

\DeclareSIUnit\hartree{\textit{E}\textsubscript{h}}
\DeclareSIUnit\planckbar{\LWR@siunitx@textplanckbar}
}% AtBeginDocument
```

\@ensuredmath is not supported inside an \hbox, so it must temporarily be restored to its original. Similar for \mbox. SVG math is created explicitly when necessary, using \LWR@subsingledollar.

\num handles optional powers (e, E, d, D), multiples (x), plus and minus, and period or comma decimal output.

To split the string, \def is used with parameter delimiters. When each of the following macro is used, extra delimiters are padded to the end of the arguments of each macro when used, and the final argument of each collects any extra unused delimiters.

# § 545 Package skmath

(*Emulates or patches code by* Simon Sigurdhsson.)

Pkg skmath skmath is used as-is for SVG math, and is emulated for MathJax.

**for HTML output:**

```
\LWR@ProvidesPackagePass{skmath}[2019/10/15]
```

Only defined if package option requested:

```
\begin{warpMathJax}
\ExplSyntaxOn
\bool_if:NT\g__skmath_define_common_sets_bool{
\CustomizeMathJax{\newcommand{\N}{\mathbb{N}}}
\CustomizeMathJax{\newcommand{\Z}{\mathbb{Z}}}
\CustomizeMathJax{\newcommand{\Q}{\mathbb{Q}}}
\CustomizeMathJax{\newcommand{\R}{\mathbb{R}}}
```

```
\CustomizeMathJax{\newcommand{\C}{\mathbb{C}}}
}
```

skmath is using l3keys, which does not seem to have an equivalent to `\@ifpackagewith`. To detect package options, comparisons with the following are made to see if various macros have been defined as follows:

```
\cs_gset_nopar:Npn\LWR__skmath_imaginary_unit:n#1{{#1}}
\cs_gset_nopar:Npn\LWR__skmath_natural_log_e:{{e}}
\cs_gset_nopar:Npn\LWR__skmath_integral_d:{{d}}
\cs_gset_nopar:Npn\LWR__skmath_total_derivative_d:{{d}}
```

If `notation=iso`, use upright, else italic:

```
\cs_if_eq:NNTF \__skmath_imaginary_unit:n \LWR__skmath_imaginary_unit:n
    {
        \CustomizeMathJax{\newcommand{ii}{\mathit{i}}}
        \CustomizeMathJax{\newcommand{jj}{\mathit{j}}}
    }
    {
        \CustomizeMathJax{\newcommand{ii}{\mathrm{i}}}
        \CustomizeMathJax{\newcommand{jj}{\mathrm{j}}}
    }
```

If `notation=iso`, use upright, else italic:

```
\cs_if_eq:NNTF \__skmath_natural_log_e: \LWR__skmath_natural_log_e:
    { \CustomizeMathJax{\newcommand{\ee}{\mathit{e}}} }
    { \CustomizeMathJax{\newcommand{\ee}{\mathrm{e}}} }
```

skmath uses `\DeclarePairedDelimiter` from mathtools for `\abs` and `\norm`, and lwarp uses this to automatically define MathJax definitions for each.

If `notation=english`, use slanted, else upright:

```
\cs_if_eq:NNTF \__skmath_integral_d: \LWR__skmath_integral_d:
    { \CustomizeMathJax{\newcommand{\d}{\mathit{d}}} }
    { \CustomizeMathJax{\newcommand{\d}{\mathrm{d}}} }
```

Used to parse comma and caret arguments for `\pd` and `\td`:

```
\CustomizeMathJax{\def\LWRskmathEND{}}
```

Parse the arguments with up to four commas. Argument 6 contains any leftover commas.

```
\CustomizeMathJax{\def\LWRskmathpdstarsub#1#2,#3,#4,#5,#6\LWRskmathEND{
    #1_{#2#3#4#5}%
}}

\CustomizeMathJax{\newcommand{\LWRskmathpdstar}[2]{%
    \LWRskmathpdstarsub{#1}#2,,,,\LWRskmathEND%
}}
```

Parse the arguments with up to two carets. Argument 3 contains any leftover carets. `\LWRskmathpdplus` is used to only place a plus sign starting after the first term.

```
    \LWRskmathtrigtwo%
}}

\CustomizeMathJax{\renewcommand{\arcsin}{\LWRskmathtrig{arcsin}}}

\CustomizeMathJax{\renewcommand{\cos}{\LWRskmathtrig{cos}}}
\CustomizeMathJax{\renewcommand{\arccos}{\LWRskmathtrig{arccos}}}

\CustomizeMathJax{\renewcommand{\tan}{\LWRskmathtrig{tan}}}
\CustomizeMathJax{\renewcommand{\arctan}{\LWRskmathtrig{arctan}}}

\CustomizeMathJax{\renewcommand{\cot}{\LWRskmathtrig{cot}}}

\CustomizeMathJax{\renewcommand{\sinh}{\LWRskmathtrig{sinh}}}
\CustomizeMathJax{\renewcommand{\cosh}{\LWRskmathtrig{cosh}}}
\CustomizeMathJax{\renewcommand{\tanh}{\LWRskmathtrig{tanh}}}
```

Common code for `\ln` and `\log`:

```
\CustomizeMathJax{\newcommand{\LWRskmathlogtwo}[2][]{%
    \ifblank{#1}{}{_{#1}}%
    \ifblank{#2}{}{\left(#2\right)}%
}}

\CustomizeMathJax{\newcommand{\LWRskmathlog}[1]{%
    \operatorname{#1}%
    \LWRskmathlogtwo%
}}

\CustomizeMathJax{\renewcommand{\ln}{\LWRskmathlog{ln}}}
\CustomizeMathJax{\renewcommand{\log}{\LWRskmathlog{log}}}

\CustomizeMathJax{\newcommand{\LWRskmathexpparens}[1]{%
    \operatorname{exp}%
    \ifblank{#1}{}{\left(#1\right)}%
}}
```

See the skmath source for the original of the following:

```
\CustomizeMathJax{\newcommand{\LWRskmathexpnostar}[1]{%
    \mathchoice
        {\ee^{#1}}
        {\LWRskmathexpparens{#1}}

        {\LWRskmathexpparens{#1}}
}}

\CustomizeMathJax{\renewcommand{\exp}{\ifstar\LWRskmathexpparens\LWRskmathexpnostar}}
```

Common code for `\min` etc:

```
\CustomizeMathJax{\newcommand{\LWRskmathminstar}[2][]{%
    \operatorname{\LWRskmathminname}%
```

```
    \ifblank{#1}{}{%
        _{\mathchoice{\mathclap{#1}}{#1}{#1}{#1}}
    }%
    \ifblank{#2}{}{#2}%
}}

\CustomizeMathJax{\newcommand{\LWRskmathminnostar}[2][]{%
    \ifblank{#1}%
        {\operatorname{\LWRskmathminname}}%
        {%
            \underset%
                {\mathchoice{\mathclap{#1}}{#1}{#1}{#1}}%
                {\operatorname{\LWRskmathminname}}%
        }%
    \ifblank{#2}{}{\left\{#2\right\}}%
}}
```

\LWRskmathminname seems to be recursion-safe since it is used immediately.

```
\CustomizeMathJax{\newcommand{\LWRskmathmin}[1]{%
    \def\LWRskmathminname{#1}%
    \ifstar\LWRskmathminstar\LWRskmathminnostar%

§ 552 Package

# splitidx

(*Emulates or patches code by* Markus Kohm.)

Pkg splitidx splitidx is patched for use by lwarp.

If the latexmk option is selected for lwarp, *latexmk* will compile the document but will *not* compile the indexes. **lwarpmk printindex** and **lwarpmk htmlindex** will still be required.

⚠ \thepage When using \AtWriteToIndex or \AtNextWriteToIndex, the user must not refer to \thepage during HTML output, as the concept of a page number is meaningless. Instead, do

```
\addtocounter{LWR@autoindex}{1}
\LWR@new@label{LWRindex-\arabic{LWR@autoindex}}
```

where the \index-like action occurs, and then refer to \arabic{LWR@autoindex} instead of \thepage where the reference should occur.

See section 671.17 in the lwarp-patch-memoir package for the \@@wrspindexhyp macro as an example.

**for HTML output:**

```
\LWR@ProvidesPackagePass{splitidx}[2016/02/18]

\catcode`\_=12%
\xpatchcmd{\newindex}
    {\jobname-#2.idx}
    {\jobname-#2_html.idx}
    {}
    {\LWR@patcherror{splitidx}{@newindex}}
\catcode`\_=8%
```

Patched to use lwarp's automatic indexing counter instead of \thepage:

```
\renewcommand*{\@wrsindex}[2][]{%
  \ifx\relax#1\relax
    \if@splitidx
      \@wrsindex[idx]{#2}%
    \else
      \def\@tempa{#2}%
      \if@verbindex\@onelevel@sanitize\@tempa\fi
      \@wrindex{\@tempa}%
    \fi
  \else
    \def\@tempa{#2}%
    \csname index@#1@hook\endcsname
%     \expandafter\ifx\csname @@wrsindex\endcsname\relax
    \addtocounter{LWR@autoindex}{1}%                    lwarp
    \label{LWRindex-\arabic{LWR@autoindex}}%    lwarp
%       \@@@wrsindex{#1}{{\@tempa}{\thepage}}%
      \@@@wrsindex{#1}{{\@tempa}{\arabic{LWR@autoindex}}}%
%     \else
%       \def\@tempb{\@@wrsindex{#1}}%
%       \expandafter\@tempb\@tempa||\\%
%     \fi
    \endgroup
    \@esphack
  \fi
}
```

lwarp defines sectioning commands with xparse, so the below patches are done as temporary redefinitions instead of being `\let`.

```
\xpatchcmd{\printsubindex}
    {\let\section\subsection}
    {\renewcommand*{\section}{\subsection}}
    {}
    {\LWR@patcherror{splitidx}{printsubindex-section}}

    {\LWR@patcherror{stackengine}{stackanchor pre}}

\xapptocmd{\stackanchor}{\end{lateximage}}
    {}
    {\LWR@patcherror{stackengine}{stackanchor app}}
```

`\Centerstack` is simply placed inside a `lateximage` with a vertical alignment:

```
\xpretocmd{\Centerstack}
    {\begin{lateximage}[\ImageAltText][][vertical-align:middle]}
    {}
    {\LWR@patcherror{stackengine}{Centerstack pre}}

\xapptocmd{\Centerstack}{\end{lateximage}}
    {}
    {\LWR@patcherror{stackengine}{Centerstack app}}
```

`\savestack` reverts to print mode while saving the box, then places it inside a `lateximage` when used:

```
\renewcommand*\savestack[2]{%
  \xdef\sv@name{\stack@macro@name{#1}}%
  \@ifundefined{\sv@name content}{%
    \expandafter\newsavebox\expandafter{\csname\sv@name content\endcsname}%

⚠ As of this version, option autobold does not appear to work for PDF output.

⚠ For MathJax, the tilde character ~ does not create \sim. Use \sim directly.

⚠ Because MathJax has limited conditional processing:

- \wrap only creates square braces, no matter what its optional arguments.
- \P, \pCau, \pN, and \pU do not handle special cases.

⚠ \and To have \and work if using \maketitle, place the following after the start of the document:

```
\newcommand*{\and}{%
    \relax\ifmmode%
        \expandafter\;\mb{\mathrm{and}}\;%
    \else%

§ 559 Package

# statistics

(*Emulates or patches code by* Julien Rivaud.)

Pkg statistics statistics is patched for use by lwarp.

⚠ \color The statistics documentation examples include the use of the \color macro. Use \textcolor instead.

⚠ math The statistics package uses math arrays, but the HTML version uses text tabulars to allow text copy/paste. If math is required, use \ensuremath or \( and \) as needed.

Pre/postline is ignored, and \hline is used instead. Each table will have an \hline above and below as a frame.

**for HTML output:**

```
\LWR@ProvidesPackagePass{statistics}[2019/09/29]

\ExplSyntaxOn
```

To use text tabular instead of math array. This allows text copy/paste of the results.

In the following, all changes for the Lwarp package are labelled "lwarp".

For MathJax. Special handling is required to parse the superscript and subscript arguments.

When a superscript or subscript is seen, it is processed and then the remainder is processesed recursively.

# § 583 Package textcomp

(*Emulates or patches code by* Frank Mittelbach, Robin Fairbairns, Werner Lemberg.)

Pkg textcomp textcomp is patched for use by lwarp.

## § 583.1 Limitations

Some textcomp symbols do not have Unicode equivalents, and thus are not supported.

⚠ missing symbols Many textcomp symbols are not supported by many system/browser fonts. In the css try referencing fonts which are more complete, but expect to see gaps in coverage.

# tikz

(*Emulates or patches code by* Till Tantau.)

Pkg tikz tikz is supported.

⚠ displaymath and matrices If using display math with `tikzpicture` or `\tikz`, along with matrices with the & character, the document must be modified as follows:

```
\usepackage{tikz}
\tikzset{every picture/.style={ampersand replacement=\&}}
```

and each instance of & in the tikz expression must be replaced with `\&`.

Accept all options for lwarp-tikz:

```

```

catcodes lwarp changes the catcode of $ for its own use. The Ti*k*z babel library temporarily changes catcodes back to normal for Ti*k*z's use. tikz v3.0.0 introduced the babel library which handles catcode changes. For older versions, lwarp must change $'s catcode itself.

## § 642 Package vwcol

(*Emulates or patches code by* Will Robertson.)

Pkg vwcol vwcol is patched for use with lwarp.

The `width` option is ignored. All `vwcol` environments adjust to 1–3 equal-width columns, depening on the width of the browser window.

The remaining options are supported, except for `lines` and `maxrecursion`.

**for HTML output:**

```
\LWR@ProvidesPackagePass{vwcol}[2015/02/10]
```

Factored from `\vwcol`. Each is given a style tag to append to the final style.

`\LWR@vwcol@addrule` {⟨*style tag*⟩}

```
\newcommand*{\LWR@vwcol@addrule}[1]{%

    \appto{\LWR@vwcolstyle}{%
        #1: %
        \LWR@printlength{\vwcol@sep} ; %
    }%
}
```

Env vwcol {⟨*key/values*⟩}

Redefine the environment to add a HTML style. The style is built depending on the required options.

```
\renewenvironment*{vwcol}[1][]{%
```

New paragraph, and process the options:

```
\LWR@stoppars%
\vwcolsetup{#1}%
```

Begin with no style:

```
\newcommand*{\LWR@vwcolstyle}{}
```

presep and postsep are created with HTML margins:

```
\if@vwcol@presep
    \appto{\LWR@vwcolstyle}{margin-left: 1em ; padding-left: .5em ; }
\fi
\if@vwcol@postsep
    \appto{\LWR@vwcolstyle}{margin-right: 1em ; padding-right: .5em ; }
\fi
```

sep becomes column-gap:

```
\ifdimgreater{\vwcol@sep}{1sp}{
    \LWR@vwcol@addgap{column-gap}
    \LWR@vwcol@addgap{-moz-column-gap}
    \LWR@vwcol@addgap{-webkit-column-gap}
}{}
```

rule become column-rule, while prerule and postrule become HTML borders:

```
\convertcolorspec{named}{\vwcol@rulecol}{HTML}\LWR@vwcol@rulecolor%
\ifdimgreater{\vwcol@rule}{0pt}{
    \ifdimless{\vwcol@rule}{1pt}{
        \setlength{\vwcol@rule}{1pt}
    }{}
    \LWR@vwcol@addrule{column-rule}

    \LWR@vwcol@addrule{-webkit-column-rule}
    \if@vwcol@prerule\LWR@vwcol@addrule{border-left}\fi
    \if@vwcol@postrule\LWR@vwcol@addrule{border-right}\fi
}{}
```

Each of the justify options becomes a text-align. Indentation is added where appropriate.

```
\ifdefequal{\vwcol@justify}{\RaggedRight}{
    \appto{\LWR@vwcolstyle}{text-align: left ; }
    \ifdimgreater{\vwcol@parindent}{0pt}{
        \appto{\LWR@vwcolstyle}{%
            text-indent: \LWR@printlength{\vwcol@parindent} ; %
        }
    }{}
}{}

\ifdefequal{\vwcol@justify}{\RaggedLeft}{
    \appto{\LWR@vwcolstyle}{text-align: right ; }
}{}

\ifdefequal{\vwcol@justify}{\Centering}{
    \appto{\LWR@vwcolstyle}{text-align: center ; }
}{}

\ifdefequal{\vwcol@justify}{\justifying}{
    \appto{\LWR@vwcolstyle}{text-align: justify ; }

            text-indent: \LWR@printlength{\vwcol@parindent} ; %
        }
```

```
    }{}
}{}
```

Create the  with the assembled style:

```
\BlockClass[\LWR@vwcolstyle]{multicols}
}
```

When the environment ends:

```
{
\endBlockClass
\LWR@startpars
}

## § 650 Package xcolor

(*Emulates or patches code by* Dr. Uwe Kern.)

Pkg xcolor xcolor is supported by lwarp.

## § 650.1 Limitations

\colorboxBlock and \fcolorboxBlock

\colorboxBlock and \fcolorboxBlock are provided for increased HTML compatibility, and they are identical to \colorbox and \fcolorbox in print mode. In HTML mode they place their contents into a  instead of a . These s are set to display: inline-block so adjacent \colorboxBlocks appear side-by-side in HTML, although text is placed before or after each.

Print-mode definitions for \colorboxBlock and \fcolorboxBlock are created by lwarp's core if xcolor is loaded.

background: none

\fcolorbox and \fcolorboxBlock allow a background color of none, in which case only the frame is drawn, which can be useful for HTML.

color support

Color definitions, models, and mixing are fully supported without any changes required.

colored tables

\rowcolors is supported, except that the optional argument is ignored so far.

colored text and boxes

\textcolor, \colorbox, and \fcolorbox are supported.

\color and \pagecolor

\color and \pagecolor are ignored. Use CSS or \textcolor where possible.

## § 650.2 xcolor definitions: location and timing

The lwarp core and its lwarp-xcolor package are tightly integrated to allow comparable results for print, HTML, and print inside an HTML lateximage. This requires a number of definitions and redefintions depending on whether each of xcolor and lateximage is being used, and whether print or HTML is being generated. Some of these actions are one-time when xcolor is loaded, and others are temporary as lateximage is used.

**When xcolor is loaded in print mode:** No special actions are taken at the time that xcolor is loaded in print mode, but see \AtBeginDocument below.

**When lwarp-xcolor is loaded in HTML mode:** xcolor's original definitions are saved for later restoration. \LWR@restoreorigformatting is appended to restore these definitions for use inside a lateximage. New HTML-mode definitions are created for \textcolor, \pagecolor, \nopagecolor, \colorbox, \colorboxBlock, \fcolorbox, \fcolorboxBlock, and fcolorminipage.

**\AtBeginDocument in print or HTML mode:** See Section 88. If xcolor has been loaded, the print-mode \fcolorbox is modified to accept a background color of none, and additional definitions are created for lwarp's new macros print-mode macros \colorboxBlock, \fcolorboxBlock, and fcolorminipage. The HTML versions of these macros will already have been created by lwarp-xcolor if it has been loaded.

For use inside an HTML lateximage, \LWR@restoreorigformatting is appended to temporarily set these functions to their print-mode versions.

**In a lateximage in HTML mode:** \LWR@restoreorigformatting temporarily restores the print-mode definitions of xcolor's functions. See \LWR@restoreorigformatting on page 535.

**\color:**

**Print:** Used as-is.

**HTML:** Ignored by *pdftotext*, and will not appear.

**HTML lateximage:** Colors will appear in a `lateximage`.

**`\textcolor`:**

**Print:** Used as-is.

**HTML:** Redefined by lwarp-xcolor, page 1214.

**HTML lateximage:** Remembers and reuses the print version.

**`\pagecolor`:**

**Print:** Used as-is.

**HTML:** Ignored.

**HTML lateximage:** Colors will be picked up in a `lateximage`.

**`\nopagecolor`:**

**Print:** Used as-is.

**HTML:** Ignored.

**HTML lateximage:** Colors will be picked up in a `lateximage`.

**`\colorbox`:**

## § 650.4 Remembering and restoring original definitions

Remember the following print-mode actions to be restored when inside a `lateximage` environment:

```
\LetLtxMacro\LWR@print@pagecolor\pagecolor
\LetLtxMacro\LWR@print@nopagecolor\nopagecolor
```

\LWR@restoreorigformatting

Inside a `lateximage` the following gets restored to their print-mode actions:

```
\appto\LWR@restoreorigformatting{%
\LetLtxMacro\pagecolor\LWR@print@pagecolor%
\LetLtxMacro\nopagecolor\LWR@print@nopagecolor%
}
```

## § 650.5 `\normalcolor`

\normalcolor

```

**for HTML output:**

```

⚠ font size In the user's document preamble, lwarp should be loaded after font-related setup. During HTML conversion, this font is used by lwarp to generate its initial PDF output containing HTML tags, later to be converted by *pdftotext* to a plain text file. While the text may be in any font which *pdftotext* can read, the math is directly converted into SVG images using this same user-selected font. `xfrac` below is set for the Latin Modern (lmr) font. If another font is used, it may be desirable to redefine `\xfracHTMLfontsize` with a different em size.

`\sfrac` `[`⟨*instance*⟩`]` `{`⟨*num*⟩`}` `[`⟨*sep*⟩`]` `{`⟨*denom*⟩`}`

A text-mode instance for the default font is provided below. The numerator and denominator formats are adjusted to encase everything in HTML tags. `\scalebox` is made null inside the numerator and denominator, since the HTML tags should not be scaled, and we do not want to introduce additional HTML tags for scaling.

In math mode, which will appear inside a `latexmage`, no adjustments are necessary.

`\xfracHTMLfontsize` User-redefinable macro which controls the font size of the fraction.

```
\newcommand*{\xfracHTMLfontsize}{.6em}

File 564 **lwarp-patch-memoir.sty**

§ 671 Package

# patch-memoir

(*Emulates or patches code by* Peter Wilson.)

Pkg lwarp-patch-memoir Patches for memoir class.

⚠ Not fully tested! Please send bug reports!

lwarp loads this package when the memoir class is detected.

⚠ captions lwarp uses caption, which causes a warning from memoir. This is normal. Adjust captions via caption, instead of memoir.

⚠ options clash While emulating memoir, lwarp pre-loads a number of packages (section 671.1). This can cause an options clash when the user's document later loads the same packages with options. To fix this problem, specify the options before loading lwarp:

```
\documentclass{memoir}
. . .
\PassOptionsToPackage{options_list}{package_name}
. . .
\usepackage{lwarp}
. . .
\usepackage{package_name}
```

⚠ version numbers memoir emulates a number of packages, and declares a version date for each which

often does not match the date of the corresponding freestanding package. This can cause warnings about incorrect version numbers. Since lwarp is intended to support the freestanding packages, which are often newer than the date declared by memoir, it is hoped that memoir will update and change its emulated version numbers to match.

`\label(bookmark){tag}` `\label` accepts an optional `(bookmark)` argument, but this is ignored in HTML.

⚠ `comment` The `comment` environment is from the comment package, and thus requires that the `\begin` and `\end` each be on its own line:

```
\begin{comment}

`\newcomment` Comments defined with `\newcomment` use memoir's defintions, and behave as expected, where the `\begin` and `\end` do have to each be on its own line.

⚠ verbatim footnotes `\verbfootnote` is not supported.

⚠ `\newfootnoteseries` `\newfootnoteseries`, etc. are not supported.

⚠ page notes lwarp loads pagenote to perform memoir's pagenote functions, but there are minor differences in `\pagenotesubhead` and related macros.

page notes with cleveref To add support for pagenotes with cleveref, add:

```
\crefname{pagenote}{page note}{page notes}
\Crefname{pagenote}{Page note}{Page notes}
```

page note `\nameref` Note that for print mode, `\nameref` print the section name where the page notes are declared in the text, but for HTML it prints the name where the page notes are printed.

⚠ poems Poem numbering is not supported.

⚠ `verbatim` The `verbatim` environment does not yet support the memoir enhancements. It is currently recommended to load and use fancyvrb instead.

⚠ glossaries The memoir glossary system is not yet supported by *lwarpmk*. The glossaries package may be used instead, but does require the glossary entries be changed from the memoir syntax to the glossaries syntax.

**for HTML output:**

```
\ProvidesPackage{lwarp-patch-memoir}
```

## § 671.1 Packages

These are pre-loaded to provide emulation for many of memoir's functions. memoir pretends that abstract, etc. are already loaded, via its "emulated" package mechanism, but lwarp is directly loading the "`lwarp-`" version of each, which happens to avoid memoir's emulation system.

## § 671.2 Label handling

Insert the lwarp label mechanism into the memoir package mechanism:

- `\@mem@old@label` is the LaTeX definition of `\label`.
- `\LWR@orig@label` adds the memoir definition.
- lwarp's `\LWR@new@label` uses `\LWR@orig@label`.
- Want memoir's `\label` to use lwarp's `\label`, which then would use LaTeX's `\label`.
- So:
  - `\@mem@old@label` becomes `\LWR@new@label`.
  - `\LWR@orig@label` becomes `\@mem@old@label`.
- cleveref then encapsulates all the above.
- For a subcaption, cleveref modifies memoir's `\sf@memsub@label`.

```
\let\LWR@orig@label\@mem@old@label
\let\@mem@old@label\LWR@new@label
```

Patches for subfloats to support additional lwarp labels:

```
\AtBeginDocument{
    \renewcommand*{\sf@@memsub@label}[1]{%
        \@bsphack
        \sf@@memsub@label@hook{#1}%
        \@memoldlabel{#1}%
        \LWR@label@createtag{sub@#1}%
        \protected@write\@auxout{}{%
            \string\newlabel{sub@#1}%
            {{\@nameuse{@@thesub\@captype}}%
            {\thepage}}}%
        \LWR@write@lwarplabel{sub@#1}%
        \@esphack
    }
}
```

## § 671.11 Floats and captions

`\@xfloat`

`\@xdblfloat`

Reestablish lwarp's takeover the float handing, which memoir tried to grab:

```
\AtBeginDocument{
\def\@xfloat #1[#2]{%
    \LWR@floatbegin{#1}[#2]
    \normalsize
    \@nameuse{#1adjustment}%
    \LWR@futurenonspacelet\LWR@mynexttoken\LWR@floatalignment%
}
\def\@xdblfloat #1[#2]{%
    \LWR@floatbegin{#1}[#2]
    \normalsize
    \@nameuse{#1adjustment}%
    \LWR@futurenonspacelet\LWR@mynexttoken\LWR@floatalignment%
}
}
```

\newfloat [⟨*1: within*⟩] {⟨*2: type*⟩} {⟨*3: ext*⟩} {⟨*4: capname*⟩}

```
\RenewDocumentCommand{\newfloat}{o m m m}{%
    \def\LWR@tempone{#4}%
    \def\LWR@temptwo{\@nameuse{#2name}}%
    \ifdefequal{\LWR@tempone}{\LWR@temptwo}{% recursive name, already defined
        \IfValueTF{#1}%
            {\DeclareFloatingEnvironment[fileext=#3,within=#1]{#2}}%
            {\DeclareFloatingEnvironment[fileext=#3]{#2}}%
    }{% not recursive name
        \IfValueTF{#1}%
            {\DeclareFloatingEnvironment[fileext=#3,within=#1,name={#4}]{#2}}%
            {\DeclareFloatingEnvironment[fileext=#3,name={#4}]{#2}}%
    }%
```

newfloat package automatically creates the `\listof` command for new floats, but float does not, so remove `\listof` here in case it is manually created later.

```
    \cslet{listof#2s}\relax%
    \cslet{listof#2es}\relax%
}
```

\newlistof [⟨*within*⟩] {⟨*type*⟩} {⟨*ext*⟩} {⟨*listofname*⟩}

Emulated through the `\newfloat` mechanism. Note that memoir uses a different syntax than tocloft for the name.

```
\RenewDocumentCommand{\newlistof}{o m m m}
{%
    \IfValueTF{#1}%
        {\newlistentry[#1]{#2}{#3}{0}}%

`\m@m@wrpnote`

`\startnoteentrystart`

To have cleveref work with page note labels, the following patch writes `\thepagenote` and also adds `\arabic{pagenote}` to the first argument written to the `.ent` file:

```
\startnoteentry{{\thepagenote}{\arabic{pagenote}}} . . .
```

The arabic value is required for cleveref. \thepagenote becomes \@firstoftwo#1 and the arabic value becomes \@secondoftwo#1.

⚠ \nameref Note that for print mode,\nameref print the section name where the page notes are declared in the text, but for HTML it prints the name where the page notes are printed.

\@@wrindexhyp

Redefined to write the LWR@autoindex counter instead of page. Note that memoir has two versions, depending on the use of hyperref.

```
\AtBeginDocument{

    \endgroup
    \@esphack}%
```

\@@wrspindexhyp

\specialindex behaves like a regular \index, pointing to where \specialindex is used. If \specialindex is used inside a figure or table after the \caption, then the hyperlink will be given the name of that particular figure or table.

```
\def\@@wrspindexhyp#1||\\{%

\makeindex Patched to use _html filename and \BaseJobname:

```
\catcode`\_=12%
\renewcommand*{\makeindex}[1][\BaseJobname]{%
  \if@filesw

# common-mathjax-overlaysymbols

Pkg Common code used by a number of packages to overlay two symbols for MathJax.

`lwarp-common-mathjax-overlaysymbols`

**for HTML output:**

```
\ProvidesPackage{lwarp-common-mathjax-overlaysymbols}[2020/08/17]
```

`\LWRoverlaysymbols` {⟨*symbol*⟩} {⟨*symbol*⟩}

Overlays one symbol over another.

```
\begin{warpMathJax}

\CustomizeMathJax{\newcommand{\LWRoverlaysymbols}[2]{%
    \mathord{%
        \smash{%
            \mathop{#2\strut}%

# Index of Objects

This is an index of macros, environments, booleans, counters, lengths, packages, classes, options, keys, files, and various other programming objects. Each is listed by itself, and also by category. In some cases, they are further subdivided by [class].

Numbers written in italic refer to the page where the corresponding entry is described; numbers underlined refer to the code line of the definition.

# Troubleshooting Index

This index is a sorted reference of problems and solutions. In order to make it easier to locate a solution, the same issue may be addressed by more than one entry.

Entries with higher page numbers are often duplicates of entries with lower page numbers, as the same warning may occur within the user manual and again within the source code for a given package.
